10.4.1 Introduction 10-8

1. Product and Client Care

1.1 As Soon As Your Scope is Delivered

We recommend you thoroughly inspect the contents of the scope packaging at once. Check all the contents against the enclosed *packing list*. Unless LeCroy is notified promptly of a missing or damaged item, we cannot accept responsibility for its replacement. Contact your national LeCroy Customer Service Department or local office immediately.

1.2 Warranty

LeCroy warrants its oscilloscope products for normal use and operation within specifications for a period of three years from the date of shipment. Calibration each year is recommended to ensure in-spec performance. Spares, replacement parts and repairs are warranted for 90 days. The instrument's firmware has been thoroughly tested and is thought to be functional, but is supplied without warranty of any kind covering detailed performance. Products not made by LeCroy are covered solely by the warranty of the original equipment manufacturer.

In exercising its warranty, LeCroy will repair or, at its option, replace any product returned within the warranty period to the Customer Service Department or an authorized service center. However, this will be done only if the product is determined by LeCroy's examination to be defective due to workmanship or materials, and the defect has not been caused by misuse, neglect or accident, or by abnormal conditions or operation.

The client will be responsible for the transportation and insurance charges for the return of products to the service facility. LeCroy will return all products under warranty with transport prepaid.

This warranty replaces all other warranties, expressed or implied, including but not limited to any implied warranty of merchantability, fitness, or adequacy for any particular purpose or use. LeCroy shall not be liable for any special, incidental, or consequential damages, whether in contract or otherwise.

1.3 Maintenance Agreements

We provide a variety of customer support services. Maintenance agreements give extended warranty and allow our clients to budget maintenance costs after the initial three-year warranty has expired. Other services such as installation, training, enhancements and on-site repairs are available through special Supplemental Support Agreements

1.4 Keeping You Up to Date

LeCroy is dedicated to offering state-of-the-art instruments, continually refining and improving the performance of our products. Because of the speed with which physical modifications may be implemented, this manual and related documentation may not agree in every detail with the products they describe. For example, there might be small discrepancies in the values of components affecting pulse shape, timing or offset, and — infrequently — minor logic changes.

However, be assured the scope itself is in full order and incorporates the most up-to-date circuitry. We frequently update firmware or software during servicing to improve scope performance, free of charge during warranty. We will keep you up to date with such changes, through manuals such as this one and other publications.

1.5 Service and Repair

Please return products requiring maintenance to the Customer Service Department in your country or to an authorized service facility. LeCroy will repair or replace any product under warranty free of charge. The customer is responsible for transportation charges to the factory, whereas all in-warranty products will be returned to you with transportation prepaid.

Outside the warranty period, you will need to provide us with a *purchase order number* before we can repair your LeCroy product. You will be billed for parts and labor related to the repair work, and for shipping.

1.6 How to Return a Product

Contact your country's Customer Service Department or local field office to find out where to return the product. All returned products should be identified by model and serial number. You should describe the defect or failure, and provide your name and contact number. And in the case of products returned to the factory, a *Return Authorization Number* (RAN) should be used. The RAN can be obtained by contacting your nearest LeCroy office, or the New York Customer Care Center or European Manufacturing in Geneva (*see chapter 2 for contact numbers*).

Return shipments should be made prepaid. We cannot accept COD (Cash On Delivery) or Collect Return shipments. We recommend air-freighting. It is important that the RAN be clearly shown on the outside of the shipping package for prompt redirection to the appropriate LeCroy department.

Wherever possible, use the original shipping carton. If a substitute carton is used, it should be rigid and packed so that that the product is surrounded by a minimum of four inches or 10 cm of shock-absorbent material.

2. General Information

2.1 Product Assistance

Help on installation, calibration, and the use of LeCroy equipment is available from your local LeCroy office, or from LeCroy's

- Customer Care Center, 700 Chestnut Ridge Road, Chestnut Ridge, New York 10977–6499, U.S.A., tel. (914) 578–6020
- European Manufacturing, 2, rue du Pré-de-la-Fontaine, 1217 Meyrin 1, Geneva Switzerland, tel. (41) 22/719 21 11.

2.3 Installation for Safe and Efficient Operation

Operating Environment

The oscilloscope will operate to its specifications if the environment is maintained within the following parameters:

Temperature.....5 to 40 °C (41 to 104 °F) rated.

Humidity.....Maximum relative humidity 80 % RH (non-condensing) for temperatures up to 31 °C decreasing linearly to 50 % relative humidity at 40 °C

Altitude.....2000 m (6560 ft)

The oscilloscope has been qualified to the following EN61010-1 category:

Installation (Overvoltage) Category II

Pollution Degree.....2

Safety Symbols

Where these symbols or indications appear on the front or rear panels, and in this manual, they have the following meanings:

..... **CAUTION**: Refer to accompanying documents (for Safety-related information). *See elsewhere in this manual wherever the symbol is present,as indicated in the Table of Contents.*

..... **CAUTION**: Risk of electric shock

..... **On (Supply)**

..... **Off (Supply)**

..... **Earth (Ground) Terminal**

..... **Protective Conductor Terminal**

..... **Earth (Ground) Terminal on BNC Connectors**

WARNING ..... **Denotes a hazard. If a WARNING is indicated on the instrument, do not proceed until its conditions are understood and met.**

The oscilloscope has *not* been designed to make direct measurements on the human body. Users who connect a LeCroy oscilloscope directly to a person do so at their own risk.

Power Requirements

The oscilloscope operates from a 115 V (90 to 132 V) or 220 V (180 to 250 V) AC power source at 45 Hz to 66 Hz. No voltage selection is required, since the instrument automatically adapts to the line voltage present.

The power supply of the oscilloscope is protected against short-circuit and overload by means of two 6.3 A/250 V AC, "T" rated fuses (size: 5 X 20 mm), located above the mains plug. Disconnect the power cord before inspecting or replacing a fuse. Open the fuse box by inserting a small screwdriver under the plastic cover and prying it open.

For continued fire protection at all line voltages, replace only with fuses of the specified type and rating (T 6.3 A/250 V).

The oscilloscope has been designed to operate from a single-phase power source, with one of the current-carrying conductors (neutral conductor) at ground (earth) potential.

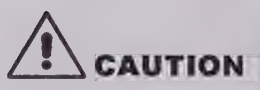
Maintain the ground line to avoid an electric shock.

None of the current-carrying conductors may exceed 250 V rms with respect to ground potential. The oscilloscope is provided with a three-wire electrical cord containing a three-terminal polarized plug for mains voltage and safety ground connection.

The plug's ground terminal is connected directly to the frame of the unit. For adequate protection against electrical hazard, this plug must be inserted into a mating outlet containing a safety ground contact.

Cleaning And Maintenance

Maintenance and repairs should be carried out exclusively by a LeCroy technician (*see* Chapter 2). Cleaning should be limited to the exterior of the instrument only, using a damp, soft cloth. Do not use chemicals or abrasive elements. Under no circumstances should moisture be allowed to penetrate the oscilloscope. To avoid electric shocks, disconnect the instrument from the power supply before cleaning.



Power On

Connect the oscilloscope to the power outlet and switch it on by pressing the power switch located on the rear panel. After the instrument is switched on, auto-calibration is performed and a test of the oscilloscope's ADCs and memories is carried out. The full testing procedure takes approximately 10 seconds, after which time a display will appear on the screen.

3. LC574A Specifications

3.1 Leading Specifications

- 1 GHz Bandwidth
- 4 GS/s Single-shot Sample Rate
- 8 Million Points of Acquisition Memory
- 4 ms Maximum Sample Rate Window
- 96 MHz PowerPC Microprocessor
- 8 to 64 Mbytes System RAM
- 9" Color Display
- Analog Persistence
- Full Screen Grid

Digital oscilloscopes from LeCroy are designed to save engineers valuable time in troubleshooting and problem-solving.
Each oscilloscope is an integrated and powerful system providing the capability to:

- **Capture** the key events with high resolution for longer time intervals
- **View** data like never before, giving you more information more quickly, with a large, color CRT and advanced display techniques
- **Analyze** your signal to get answers quickly and more accurately with a powerful processing system and math packages.

3.2 Signal Capture

Acquisition System
Bandwidth (-3 dB):
@ 50Ω: DC to 1 GHz
@ 1 MΩ DC:DC to 500 MHz typ. at probe tip.
No. of Channels: 4
No. of Digitizers: 4 at 1 GS/s, 4 GS/s single channel mode.
Max. Sample Rate Window: 4 ms @ 4 GS/s in single-shot mode.
Sensitivity:
50Ω : 2 mV/div to 1 V/div
1MΩ : 2 mV/div to 5 V/div
Scale factors: A wide choice of probe attenuation factors are selectable.
Offset Range:

2.0-4.99 mV/div:	±400 mV
5.0-99 mV/div:	±1V
.100-1.0 V/div:	±10V
1.0-10.0 V/div:	±100 V (1MΩ only)

DC Accuracy: 1% typical; guaranteed ≤ ±2% full scale at 0 V offset.
Vertical Resolution: 8 bits.
Bandwidth Limiter: 25 MHz, 200 MHz.

Input Impedance: 1MΩ//11pF (system capacitance using PP005 or 50 Ω ±1%.
Max Input:
50 Ω: ±5 V DC (500 mW) or 5 V RMS.
1 MΩ: 400 V (DC+ peak AC ≤10 kHz).

Channel use	Maximum Sample Rate	LC574A	LC574AM	LC574AL	Active Channels
All Peak Detect Off	1 GS/s	100 k	500 K	2 M	All
Paired Peak Detect Off	2 GS/s	250 k	1 M	4 M	Ch2&Ch3
Paired+Adapter Peak Detect Off	4 GS/s	500 k	2 M	8 M	One
All Peak Detect On	100 MS/s data + 400 MS/s peaks	50 k data + 50 k peaks	250 k data + 250 k peaks	1 M data + 1 M peaks	All

SMARTMemory: This total memory management system dynamically manages acquisition memory to guarantee that signals are always sampled at the highest possible sample rate and that system RAM and microprocessor power resources are always optimally employed.

3.3 Acquisition Modes

Random Interleaved Sampling (RIS):
For repetitive signals from 1 ns/div to 2 µs/div.
Single shot:
For transient and repetitive signals from 1 ns/div (all channels active).
Peak detect: At 400MS/s, peak detect can capture high-speed events down to 1ns, while simultaneously capturing normally sampled data.
Sequence: Stores multiple events in segmented acquisition memories.
Dead Time between segments: Typically < 30 µs, max. 50 µs.

Number of segments available:
LC574A : 500.
LC574AM : 2,000.
LC574AL : 2,000.

3.4 Timebase System

Timebases: Main and up to 4 Zoom Traces.
Time/Div Range: 1 ns/div to 1,000 s/div.
Clock Accuracy: ≤10 ppm.
Interpolator resolution: 10 ps.
Roll Mode: Ranges 500 ms to 1,000 s/div.
For > 50k points: 10 s to 1,000 s/div.
External Clock: 20 - 100 MHz on EXT input with ECL, TTL or zero crossing levels.
Optional 50 MHz to 500 MHz rear panel fixed frequency clock input.
External Reference: Optional 10 MHz rear-panel input.

3.5 Triggering System

Modes: Normal, Auto, Single, and Stop.
Sources: CH1, CH2, CH3, CH4 Line, Ext, Ext/10. Slope, Level and Coupling are unique to each source.
Slope: Positive, Negative.
Coupling: AC, DC, HF, LFREJ, HFREJ.
Pre-trigger recording: 0 to 100% of full scale (adjustable in 1% increments).
Post-trigger delay: 0 to 10,000 divisions (adjustable in 0.1 div increments).
Holdoff by time: 10 ns to 20 s.
Holdoff by events: 0 to 99,999,999.
Internal Trigger Range: ±5 div.
EXT Trigger Max Input: 10MΩ//15pF (system capacitance using PP005):
400V(DC+peakAC≤10kHz)
50Ω ±1%: ±5 V DC (500 mW) or 5 V RMS.
EXT Trigger Range: ±0.5 V (±5 V with Ext/10).
Trigger Timing: Trigger Date and Time are listed in the Memory Status Menu.
Trigger Comparator: Optional ECL rear panel output. Alternatively, the calibrator output can provide a trigger output or a PASS/FAIL test output.

3.6 Smart Trigger Types

Pattern: Trigger on the logic combination of 5 inputs - CH1, CH2, CH3, CH4, and EXT Trigger, where each source can be de-fined as High, Low or Don't Care. The Trigger can be defined as the beginning or end of the specified pattern.
Signal or Pattern Width: Trigger on width between two limits selectable from ≤ 2.5ns to 20s. Will typically trigger on glitches 1ns wide.
Signal or Pattern Interval: Trigger on interval between two limits selectable from 10ns to 20s.
Dropout: Trigger if the input signal drops out for longer than a time-out from 25ns to 20s.
State/Edge Qualified: Trigger on any source only if a given state (or transition) has occurred on another source. The delay between these events can be defined as a number of events on the trigger channel or as a time interval.
TV: Allows selection of both line (up to 1500) and field number (up to 8) for PAL, SECAM, NTSC or non-standard video.
Exclusion Trigger: Trigger on intermittent faults by specifying the normal width or period of a signal. The oscilloscope will trigger only on aberrations which are shorter or longer than normal.

3.7 Autosetup

Pressing Autosetup sets timebase, trigger and sensitivity to display a wide range of repetitive signals. (Frequency above 50Hz; Duty Cycle greater than 0.1%).
Autosetup Time: Approximately 2 seconds.
Vertical Find: Automatically sets sensitivity and offset for selected channel.

3.8 Probes

One PP005probe is supplied per channel. DC to 500 MHz typical at probe tip, 500 V max.
Probe calibration: Max 1 V into 1 MΩ, 500 mV into 50 Ω, frequency and amplitude programmable, pulse or square wave selectable, rise and fall time 1 ns typical.

3.9 9" Color Display

LeCroy provides a very large, sharp oscilloscope screen that is 50% larger in total viewing area than a 7" screen.

Its powerful features include Analog Persistence, Color Graded Persistence, Full Screen mode, Opaque or Transparent display, color association and personal color schemes. These provide the user with outstanding benefits that accelerate visual processing and effective communication of on-screen information.

3.10 High Speed Acquisition

The design and debug of fast digital systems and the need to capture fast transient signals require high speed signal capture. The LC574AA four channel 1 GS/s, 1 GHz bandwidth DSO operates at a 4 GS/s sample rate for single channel inputs. The high sample rate, bandwidth and the 1 GHz trigger bandwidth provide a flexible solution for capturing and viewing fast rise time signals.

3.11 Large Sample Rate Window

Having a high sample rate in a DSO is only the first step to preserving data integrity. The time window over which this sample rate is available is also of critical importance.

Long acquisition memory maintains the oscilloscope's highest sample rate for large time windows allowing the user to sample long signals with high horizontal resolution.

With up to 8 million points of acquisition memory the maximum sample rate of these oscilloscopes of 4 GS/s is maintained for a time window of 2ms. This sample rate window - 16 times greater than the maximum sample rate window of competing DSOs - enables the user to record long signals with high resolution.

3.12 Optimum Performance

SMARTMemory is a Total Memory Management system that dynamically allocates resources of microprocessor power, acquisition memory and processing RAM. The intelligent management provided by SMARTMemory guarantees optimal usage of oscilloscope resources.

The 96 MHz PowerPC microprocessor at the heart of these DSOs drives the system to produce results fast, providing rapid waveform update and super panel responsiveness.

3.13 Quick Diagnoses

Capturing and viewing waveforms is fundamental to an oscilloscope. Productivity improvements are accessible by using built-in math functions to assist troubleshooting and diagnoses of circuit problems.

The signal analysis capability of these DSOs is enhanced by advanced waveform math, spectrum analysis, and waveform parameter analysis. This analysis capability greatly increases the speed with which circuit problems are clearly identified and solved.

3.14 Analog Persistence

At a push of the green button the user can switch between an analog view and a digital view of signals on these oscilloscopes.

The depth of signal information can be explored along the third dimension of the waveform display to give the user a complete picture of waveform activity.

Unlike an analog oscilloscope, all signal data is captured and available in memory for analysis and measurements. Analog Persistence gives the user the best of both the analog and digital world of oscilloscopes.

3.15 Full Screen Grid

These LeCroy DSOs not only have a very large 9" screen but also provide a display mode with an extra-large grid, up to 150% larger than common grid areas. In Full Screen mode, all of the screen area is used to display signals. This provides a magnificent view of up to 8 waveforms: signal details are seen more clearly and with greater ease.

3.16 8 Trace display

8 trace display with any combination of math functions, zooms, reference memories or channels.

Octal grid display in normal and Full Screen display modes, with and without parameters displayed.

3.17 Easy Documentation

All waveform data and results of analysis can be quickly saved to floppy disk, memory card, ATA flash card, or a removable hard disk. This provides an efficient way to archive information and facilitates easy documentation of results.

An optional internal graphics printer outputs screen dumps in seconds providing the user with an immediate and clear record of signal activity.

3.18 Signal Viewing

Type: Color 10" Raster Scan CRT, 0.26mm dot pitch.
Resolution: 640 x 480 points.
Display Area: 170mm x 125mm - 50% greater than that of a 7" display.
Controls: Rear-Panel presets for position, brightness and contrast.
Menu controls for brightness and color selection.
Grid Styles: Single, Dual, Octal, Quad, XY, Single+XY, Dual+XY, and Full Screen an enlarged view of each grid style.
Graticules: Internally generated; separate intensity control for grids and waveforms. Selectable blending of grid with displayed traces.
Waveform Style: Dot Join with optional sample point highlight or Dots only.
Persistence Modes: Color graded persistence and analog persistence, infinite or variable with decay over time. In color graded persistence a color spectrum from red through violet is used to map signal intensity. With Analog Persistence the brightness level of a single color denotes signal intensity. Each trace's persistence data is stored in 64k levels.
Trace Display: Opaque or transparent mode, with overlap management.
Number of Traces: 8 (any mix of channels, memories or Math functions).
Real-time Clock: Date, hours, minutes, seconds.
External Monitor: Rear-panel 15-pin socket for VGA compatible monitor.
Vertical Zoom: Up to 5x vertical expansion to a maximum of 5 mV/div (50x with averaging)
Horizontal Zoom: Waveforms can be expanded to give .4-.5 points/division. Zoom factors up to 2,000,000x with all channels combined for the 'AL' model.

3.19 Signal Analysis

A comprehensive and easy-to-use set of diagnostic tools are available. Calculations are performed rapidly and results can be presented on-screen or stored to disk.
Rapid Processing System
Microprocessor: 96 MHz PowerPC™ 603e.
System RAM: 8 to 64 Mbytes.
Video Memory: 1 Mbyte.
Cache Memory: 32 kbyte.
Persistence Data Map Memory: 16 bits per displayed pixel (64k levels).

3.20 Waveform Processing

Up to four processing functions may be performed simultaneously. Standard functions available are: Add, Subtract, Multiply, Divide, Negate, Identity, Summation Averaging and Sine x/x. The source information for a math function trace can be data from an acquisition channel or from another math function trace. This allows display of traces which "daisy chain" math functions.
Average: Up to 10^6 averages are possible.
Extrema*: Roof, Floor, or Envelope values from 1 to 10^6 sweeps.
ERES*: Six Low-Pass digital filters provide up to 11-bit vertical resolution. Sampled data is always available, even when a trace is turned off.
FFT*: Spectrum Analysis with five windowing functions and FFT averaging.

3.21 Statistical Diagnostics*

The Parameter Analysis package permits in-depth diagnostics on waveform parameters. Live histogramming of any waveform parameter measurement is possible and the histogram can be autoscaled to display the center and width of the distribution.
Any of the above processes can be invoked without losing the data.

*Extrema and ERES modes are provided in the Advanced Waveform Math Package. FFT is in Spectrum Analysis. Histogramming and trending is part of the Parameter Analysis Package.

3.22 Internal Memory

Waveform Memory: Up to four 16-bit Memories (M1, M2, M3, M4), whose length corresponds to the length of the channel acquisition memory.
Zoom & Math Memory: Up to four 16-bit Waveform Processing Memories (A, B, C, D), whose length corresponds to the length of the channel acquisition memory.
Setup Memory: Four non-volatile memories. Optional Memory Cards, Flash Disks or removable Hard Disks may also be used for high-capacity waveform and setup storage.

3.23 Cursor Measurements

Relative Time: Two cursors provide time measurements with resolution of ±0.05% full scale for unexpanded traces; up to 10% of the sampling interval for expanded traces. The corresponding frequency value is displayed.
Relative Voltage: Two horizontal bars measure voltage differences up to ±0.2%, of full scale in single-grid mode.
Absolute Time: A cross-hair marker measures time relative to the trigger and voltage with respect to ground.
Absolute Voltage: A reference bar measures voltage with respect to ground.

Automated Measurements

A wide range of pulse parameter measurements are available. These are categorized for ease of use. The categories include Pulse, Horizontal, and Vertical parameters. Basic statistical measurements, included as standard, (average, highest, lowest, and standard deviation) can be made on these parameter measurements in order to understand their distribution. Pass/Fail Testing and Waveform Limit testing using masks can be performed. Test conditions can be expressed as either waveform parameter limits, waveform shape limits (mask) or a combination of both. Any failure can cause preprogrammed actions such as Hardcopy, Save, GPIB service request, logic pulse out, audible beep, or any combination of the above.

3.24 Additional Information

Interfacing

Remote Control: Possible by GPIB and RS-232-C for all front-panel controls, as well as all internal functions.
RS-232-C Port: Asynchronous up to19.2 Kb/s for computer/terminal control or printer/plotter connection.
GPIB Port: (IEEE-488.1) Configurable as talker/listener for computer control and fast data transfer, up to 300 kbytes/sec. Command Language complies with requirements of IEEE-488.2.
Centronics Port: Hardcopy parallel interface is standard.
PC Card (PCMCIA I/II/III) Ports: For memory cards, ATA compatible flash cards and removable hard disks - optional.
Floppy Disk: High density 3.5" floppy disk drive (DOS format) is standard.
VGA Compatible Display: 15-pin D-type VGA compatible connector for external color display.
Hardcopy: Screen dumps are activated by a front-panel button or via remote control. TIFF and BMP formats are available for importing to Desktop Pub-lishing programs. The following printers can be used to make hardcopies:
B/W: HP LaserJet, HP DeskJet 500, Epson FX.
Color: HP DeskJet 550C, Epson Stylus. An optional internal high resolution graphics printer is also available for screen dumps; a stripchart output format with 2 meters per division is also possible.
Output Formats: ASCII waveform out-put is available in seconds, compatible with spreadsheets, MATLAB™, MathCad™. Binary output is also available.

General

Auto-calibration ensures specified DC and timing accuracy.
Temperature: 5° to 40°C (41° to 104° F) rated 0° to 50°C (32° to 122° F) operating.
Humidity: 80% for temperatures up to 31°C decreasing linearly to 50% relative humidity at 40°C.
Altitude: Up to 2000m (operating), 40°C max.
Power: 90-132V AC, 180-250V AC, 45-66 Hz, 400 W.
Battery Backup: Front-panel settings maintained for two years.
Dimensions: (HWD)10.4" x 15.65" x 17.85", 264 mm x 397 mm x 453 mm.
Weight: 20kg (44 lbs) net, 28 kg (61.6 lbs) shipping.
Warranty: Three years.
UL: Meets UL safety standards.

CE Approval

EMC: Conforms to EN50081-1,EN50082.
Safety: The oscilloscope has been designed to comply with EN61010-1 Installation Category (Over-voltage Category) II, 300V, Pollution Degree 2.

4. Theory of Operation

4.1 Processor Board : F9601-1-8 or F9601-1-64

MPC603e Processor

This processor board is based on to the Power MPC603e processor.
It is a 64-bit RISC processor with 2x32kbyte cache. It features high speed processing and fast memory accesses.
The processor is set to an internal clock of three times the external bus clock (3x32MHz = 96 MHz), and used in a 32-bit mode.

There are two "worlds" on the board:

- the 32-bit world, including the main PowerPC processor, the dynamic RAM modules and the VGA interface;
- the 8 or 16-bit world, including all other on-board peripherals, external small peripherals and acquisition board.

A MC68150 dynamic bus sizer is used as an interface between the two worlds.

Power Supplies

The board uses three power supplies from the main acquisition board: Vcc, +15V and -15V. Vee is wired on a connector for board test purposes.
The +15V supply OP-amps on the 9601-1 board, and +15V and -15V supply small peripherals.
The current processor needs a 3.3V power supply, all the rest of the logic needs 5V. All signals are TTL compatible.
The PLL circuit (88916) generates a PLL_LOCK signal, which is used to clamp the 3.3V and 2.5V references as long as the 32MHz clock is not stable. The processor also needs to be protected against too big voltage differences between 2.5V and 3.3V (diodes on the reference).
An OP-amp and a MOSFET transistor for each power supply are used. The reference voltages are taken directly from the 5V power supply by a resistive divider.
Capacitors and a few diodes ensure that the supplies do not exceed dangerous levels at power-up, nor rise too fast.

32-bit Peripherals

There are only three devices hooked up on to the processors 32-bit data bus:

- the VGA video controller
- the DRAM system
- the bus sizer, bridge to the 68k-like world

Processor Block Diagram

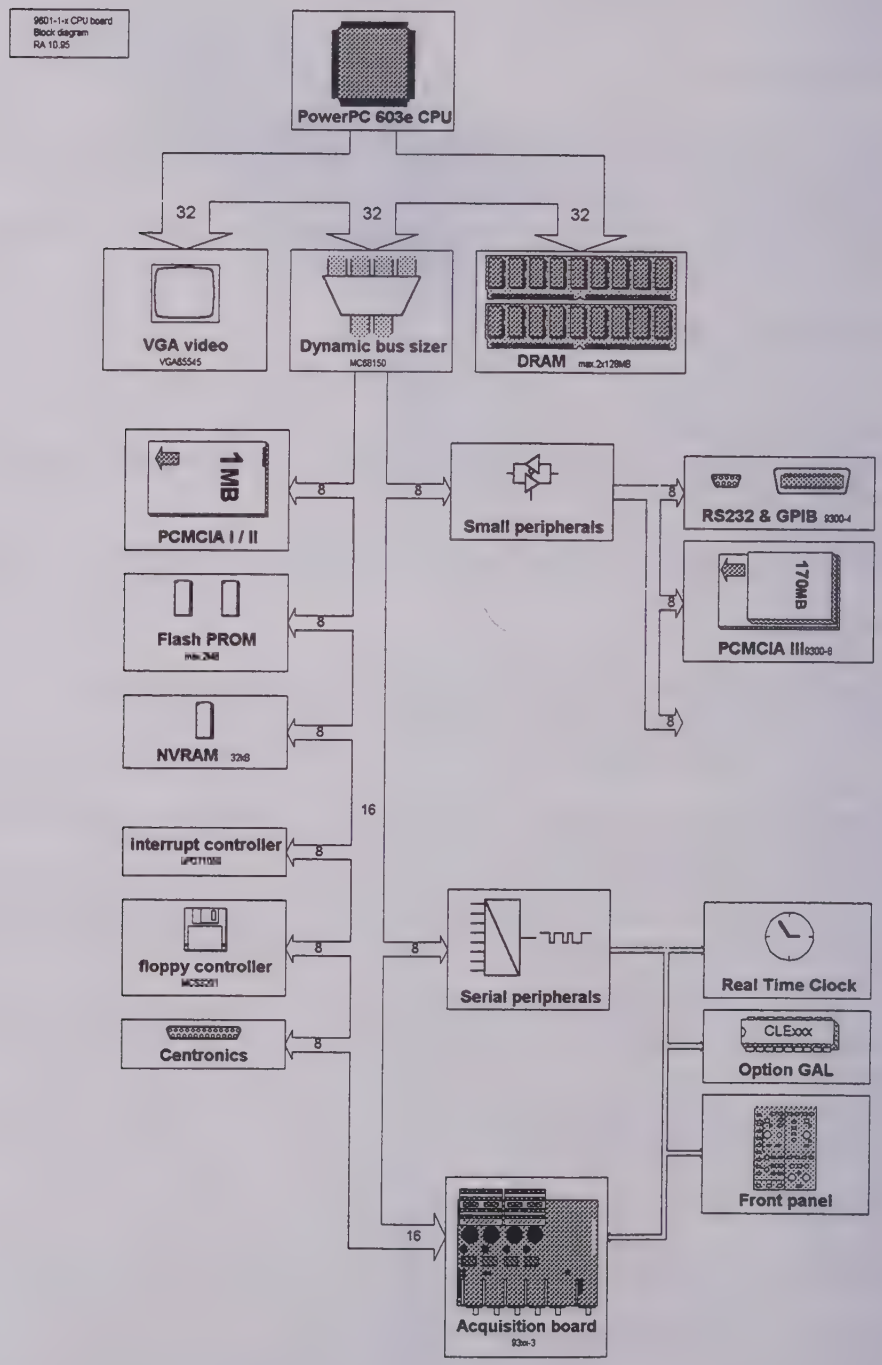


Fig 4-1 9601-1 Block diagram

DRAM

The DRAM consists of two SIMM modules from 4 MB up to 32 MB each.
By interleaving two SIMMs, the access time is dramatically reduced (one beat every 30ns, while the other module "recovers" from the previous access).
The DRAM control logic, including refresh control, is built around several GALs and a few gates.
RAMEUR (A44) is the main sequencer. It inserts refresh cycles whenever needed, and drives row and column addressing timing.
RASADE (A39) controls the row address select lines of the memory modules, and generates the addresses for double beat or burst accesses.
OCCASE (A37) generates the column address select lines of the SIMMs.
DRAME (A57) holds some glue logic, and a state machine that counts the number of beats, inserting pauses in the access if necessary (single SIMM support).
Four multiplexers (A40, 42, 46 and 47) switch between odd and even addresses to be sent to the address lines of the modules. One more multiplexer (A38) switches low order address bits, routing them either directly to the processor, or to the DRAM address generator in RASADE.

Normal Access Timing

This is the simplest access possible: the processor puts an address onto the address bus, and reads back or writes one long word (32-bit wide) to DRAM. Depending on the address (odd or even), bank A or bank B is selected in a dual SIMM configuration.

Burst Access Timing

A burst access on a 603e configured as a 32-bit device, consists of either two ("double beat") or eight ("burst") successive reads in DRAM. The idea is to put a start address onto the address bus, and read back or write several data's from or to DRAM every clock cycle, without the processor incrementing the address (this is done by the external logic). To increase system performance, the memory has been interleaved, allowing each module to access a memory location every 60ns, but with a delay of 30ns between the modules.
A burst access is signaled by an active low _TBST signal and a 32-bit access (SIZ2..0= 011), a double-beat access is indicated by a high _TBST but an access size of 64 bits (SIZ2..0= 100). The double-beat case is decoded by a GAL (VIADUC), and the signal is named _DBEAT (active low).

Refresh Timing

The 32 kHz clock from the real time clock chip is used to refresh periodically the DRAM.
The GAL RAMEUR generates the refresh cycles, as well as the sequencing of _RAS and _CAS. Depending on the operating mode, it chooses to access slot A or selects alternately slots A and B.

Memory Mapping

By default, the board is set to the biggest memory size possible. The software checks out for "holes" in the addressing space, and sets accordingly two configuration lines, MAP1 and MAP0.

MAP1..0	meaning
00	2x4, single sided SIMMs
01	2x8 MB SIMMs
10	2x32 MB SIMMs

VGA

The VGA 65545 controller chip (A27) includes its own address decoding logic. It generates all video signals (red, green and blue video, horizontal and vertical syncs, and all control lines to drive a flat panel) and controls its associated 1 MB video dynamic RAM (reads, write and refresh cycles).
All timings are extracted from the 16 MHz bus clock, so no external crystal or timebase is needed.

The horizontal and vertical sync. signals are sent to both the internal and the external video connector (high density DB15 on the 9601-2 board). The external syncs are direct, the internal syncs pass through the GAL VIADUC (A32), allowing to force these two lines to ground. This puts the internal display in power down mode (standby mode).
The chip can support several bus interfaces (PCI, ISA, VL,), it is configured as VL-bus.

The 65545 chip generates red, green and blue video signals. These are controlled-impedance lines (37.5 Ohm approximately, which corresponds to two 75 Ohm loads in parallel). A low-pass filter is implemented right at the outputs from the VGA controller, and another low-pass filter is located at each video connector on the 9601-2 board (just after the "active" load).

9601-2 Board: VGA proper termination (auto termination)

The 9601-2 board is a complement to the 9601-1 main processor board. It holds the external Centronics connector (female DB-25) with its EMI filters, both internal and external VGA connectors (female mini DB-15), and line termination for R, G and B signals.

The VGA controller is able to drive a load of 37.5 Ohms on its Red, Green and Blue outputs (two 75 Ohms loads in parallel). The line impedance of these signals on the processor board is therefore close to 37.5 Ohms. The 9601-2 board includes a special termination circuit that keeps the loads on the R, G and B lines at 37.5 Ohms, no matter if one or two 75 Ohms loads are connected. The circuit assumes that a 75 Ohms load is present on each output.

Bus Sizer

The MPC603e processor does not support dynamic bus sizing, as did the 68k family. Many parts of the software and the hardware rely on that feature. A Motorola MC68150 chip 'translates' the PowerPC 32-bit data bus to a 68030 8 or 16-bit bus. Except DRAM and VGA controller, all peripherals work on this 68k-type bus. Full compatibility is therefore ensured with current acquisition boards and small peripherals.

16 and 8-bit Peripherals

The only 16-bit peripheral hooked on the bus is the acquisition board.
RETINE (A36) generates wait state timings and is used to switch between cold boot (return to default state) and warm boot (do a RESET, but keep current scope settings), and generates a bus error if max. access time is out and no peripheral has acknowledged the access.
ASSISE (A21) generates chip select signals for the bus sizer, BUDGET (A28) creates typical 68k signals (_BAS, _BDS, 16MHz clock).
The peripheral address decoding is done by a set of GALs (GRANDS (A20), PETITS (A29)) and a few multiplexers (A30, A22). GRANDS selects between main peripheral categories (VGA, DRAM, memory card, flash PROM, acquisition board or other peripherals), PETITS generates chip select signals for 8-bit peripherals (flash PROM, memory card, non-volatile RAM, Centronics and "others"). It also determines how many wait states are needed for peripherals not able to acknowledge a bus access. This is done by pulling low _DSACK0 after having sensed the corresponding number of wait states trough _BWT1 and _BWT3, which ends the current access.
The multiplexer A30 does a finer decoding between "others" decoded in PETITS, namely interrupt controller, small peripherals, serial interface, flash PROM chip 1 or 2, and status registers.

PCMCIA type I / II interface

This interface consists mainly of buffers for both data and address busses.
An OP amp (A10) and a MOS transistor (Q3) allow to switch off the memory card power supply while no card is plugged in, and turn it on slowly when plugged in.
The GAL CARDAN (A11) handles the card format and generates several control signals accordingly.
A16 (an hex D-type flip-flop) holds control bits for 12Vpp (flash programming voltage), DRAM memory mapping and memory card type. All bits of this register reset to zero when the _RESET signal goes active low, which means that their state is also guaranteed at power-up.
A9 and A12 are the read registers for several status bits.
Several EXOR gates (A17 and A18) invert the most significant address bits of the memory card whenever the SWAP jumper is plugged in, so that the first bytes are always located at 0xFFF00000, regardless of the size of the memory card. This allows to boot directly from a PCMCIA memory card.

Flash PROM

Two Intel 28F008-compatible 1MB PROMs (A24 and A25), are used.
From a hardware point of view, a flash PROM is the same as an EPROM in read mode. To write to it, however, a programming voltage (Vpp) needs to be applied to a pin. The 12V voltage is generated by a switching regulator (A26), controlled by a logic level (_EPPP).

NVRAM

This chip is powered through the lithium battery (VCT) when power is off. The chip select is held high through a pull-up resistor to VCT to avoid accidental overwriting while power is off.

Interrupt Controller

In order to keep compatibility with both 68k hardware and software, it is necessary to use a chip that prioritizes several interrupt sources. This is done by an NEC chip, a uPD71059. It scans eight interrupt pins and sends a unique interrupt to the processor when a (non-masked) interrupt appears.

Interrupt levels are assigned the following:

level 0	(lowest priority) acquisition board
level 1	small peripherals, unused
level 2	RS232
level 3	GPIB
level 4	small peripherals and acquisition board, unused
level 5	real time clock
level 6	time base (acquisition board)
level 7	(highest priority) only for test purposes. Linked to level 2 for debugging.

Floppy Controller

The floppy controller chip directly interfaces to a double or high-density disk drive. The floppy controller has a digital 8-bit input/output register, which is used to read several status lines from the drive (disk inserted, etc.).
In principle, the controller is able to provide an interrupt when accesses are completed. As these accesses are performed in non-time critical paths of the program, The interrupt line has been wired to the input register, so that the program has to poll this register until the interrupt line goes active.
The controller has it's own timebase, a 24MHz crystal.

Centronics

Both external and internal Centronics ports are write-only. The data get latched in a 74HCT374 register (A45 for internal Centronics, A55 for external).

Small Peripheral Interface

This 8-bit interface is intended to allow external expansion to the processor board. A56 and A53 (74HCT541 tri-state buffers) buffer the address and control lines, and A62 (74HCT245, bi-directional tri-state buffers) buffer the data lines.
The address decoding is done on each peripheral board. The acknowledge for each access is also done by the peripheral device, so that there is no restriction on wait-states. The bus clock runs at 16mhz, and a reset line reinitializes the boards at the same time as the CPU.
Four interrupt lines are also included in this interface, so that interrupt-driven boards can be used (a good example is the 9300-4 GPIB/RS232 board, which uses interrupts 2 and 3).

Serial Interface for on-board Peripherals

Two GALs (SEVERE and SAVEUR) are used to access serial on-board devices, like the real time clock, option GAL, front panel and some parts of the acquisition board. The principle of such a serial access is the following:
every write or read to the serial interface allows to write or read one bit (the MSB of the byte). To write a byte to a serial device, you need eight accesses to the serial interface.
Many serial devices need the same protocol: you first send a command byte (read, write, clear, etc.), and then read or write one or several data (if required).
Depending on the address the serial interface is been accessed, the corresponding device gets selected (_SSER, _SFPR, _SLED or SRTC lines). A clock (_SCKA), a read data (SDRA or SDRD) and a write data (SDWA or SDWD) constitute the serial interface itself (the D suffix on read and write data lines means Digital, i.e. devices on the CPU board; an A suffix means devices on the Acquisition board).

RTC

The 68HC68T1 real time clock has several functions:

- keep a time-of-the-day and current-date information while the DSO is not powered on.
- generate a 32kHz clock for DRAM refreshment.
- generate a 128Hz periodic interrupt to force bus accesses from the processor (otherwise the watchdog timer would time out and reset the board) and allow periodic update of the time display ("scope alive").

The chip uses it's own 32.768kHz crystal to keep the time and derive all timings. A few discrete components around it leave the chip powered by the backup lithium battery while the rest of the board is not powered, and charge the battery when the power is on again.

Option GAL

The option GAL is a hardware key to unlock specific software functionality's. A pattern is sent to the GAL, which responds with another pattern. If the two fit, the feature is unlocked.

Front Panel

The front panel LED can be controlled by a serial write access. The LED (write only) shares the same address as the option GAL (read only).
The LED is driven by the less significant bit (LSB) of the control register.

Watchdog and Reset Generation

The power supply is monitored by a TL7770-5 chip. Whenever the Vcc voltage goes below 4.8V (even for a short time !), a reset pulse is generated, whose width is determined by an RC time constant (33uF and internal resistor).
The second half of this chip serves as watchdog circuit. The processor needs to poll a sense line on that chip from time to time (typically a few ms). By doing this, a capacitor (33uF) is discharged. When not polled, it gets charged by a constant current, and when a given threshold is exceeded, a reset pulse is generated.
The LED connected goes off whenever the _RESET line is low, so a blinking LED indicates either no bus access for longer than a few hundreds of ms, or a problem (glitch) on the Vcc power supply.

Bus Error Generation

A bus error exception is generated when the _TEA pin is pulled low on the processor. The 603e expects a _TA signal as an acknowledge to the current data transaction, and inserts wait states as long as _TA has not been pulled low at the correct timing (refer to the MPC603e documentation for exact timing information's). An external circuit is required to break the pending cycle if no device responds after a given time-out.
This is the job of the GAL RETINE (A36), which counts the number of wait states already passed (4 bit Gray counter). An external 4-bit counter (A59) extends the count to 160 (tbd) wait cycles before triggering a bus error.
An acknowledge (_DSACK1..0 lines) aborts the time-out count and finishes successfully the current cycle.

I/O Structure and GALs Involved

The following bloc diagram describes the peripheral decoding flow, and what GAL is involved in the decoding. The three frames group the peripherals into 8, 16 or 32-bit devices. The simple 3D-blocs represent an on-board device. The 3D-blocks with an arrow represent external devices (more generally: accessed through a connector).
GRANDS does the main decoding of peripherals and the 93xx-3 acquisition board.
PETITS does the sub-decoding for all 8-bit peripherals.
VIADUC handles the Motorola to Intel format decoding for the VGA controller.
CARDAN takes care of the PCMCIA interface timings.
PROFIL dispatches 8-bit data to the Centronics or the Floppy controller.
SAVEUR and SEVERE generate the serial clock and routes the data to the right serial device, including CLExxx, which is the option PAL.

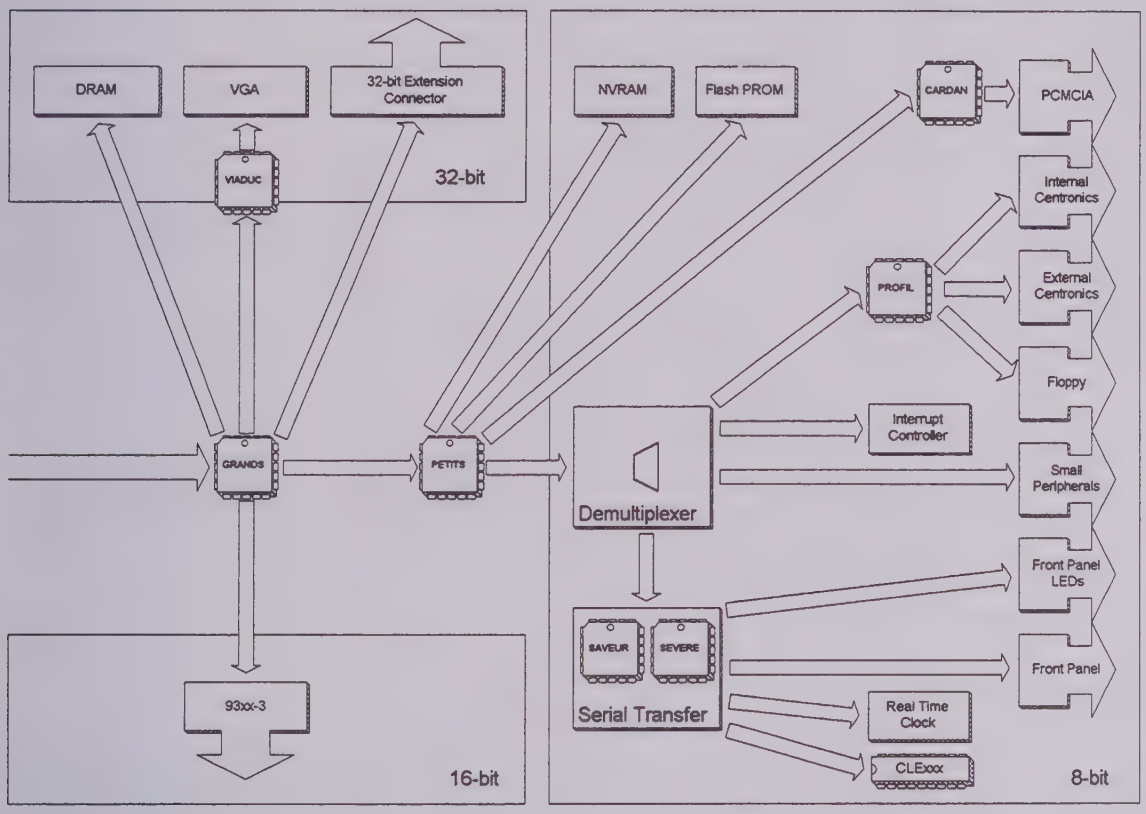

Fig 4-2 Peripheral Decoding and Data Bus Size

Not shown in Fig.4-2, are a few GALs for miscellaneous functions (like DRAM refreshing).
RASADE generates the RAS signals and the lower addresses for DRAM. It also supports the signals needed for interleaved burst mode.
OCCASE generates the CAS signals for DRAM.
RAMEUR is the main sequencer for the DRAM , and handles the access precharge and the refresh system.
BUDGET translates a 680x0 bus cycle into a PPC cycle, and handles fast cycles, like accesses to DRAM or VGA.
RETINE counts the wait states and generates a bus error if no response after too many (153) wait states. It also generates the system reset.
ASSISE decodes CPU space cycles and controls the bus sizer.

4.2 F9384-31 (900022) Main Board

4.2.1 Introduction

The board is divided into five sections :

- Microprocessor control.
- Front-end
- Trigger
- Analog to Digital Converter and memory
- Time base

4.2.2 Microprocessor Control

The microprocessor interface provides the address, data, and control interface for the microprocessor card plugged into connector J1. This is the only interface to the data acquired by the acquisition card. This interface is essentially identical to the 9354 and 9374 interface. The main power supplies provided on connector J2 are +/-15 volts, +/-6 volts, +/-5 volts, and +3.3 volts.

4.2.2.1 Data Bus Buffer

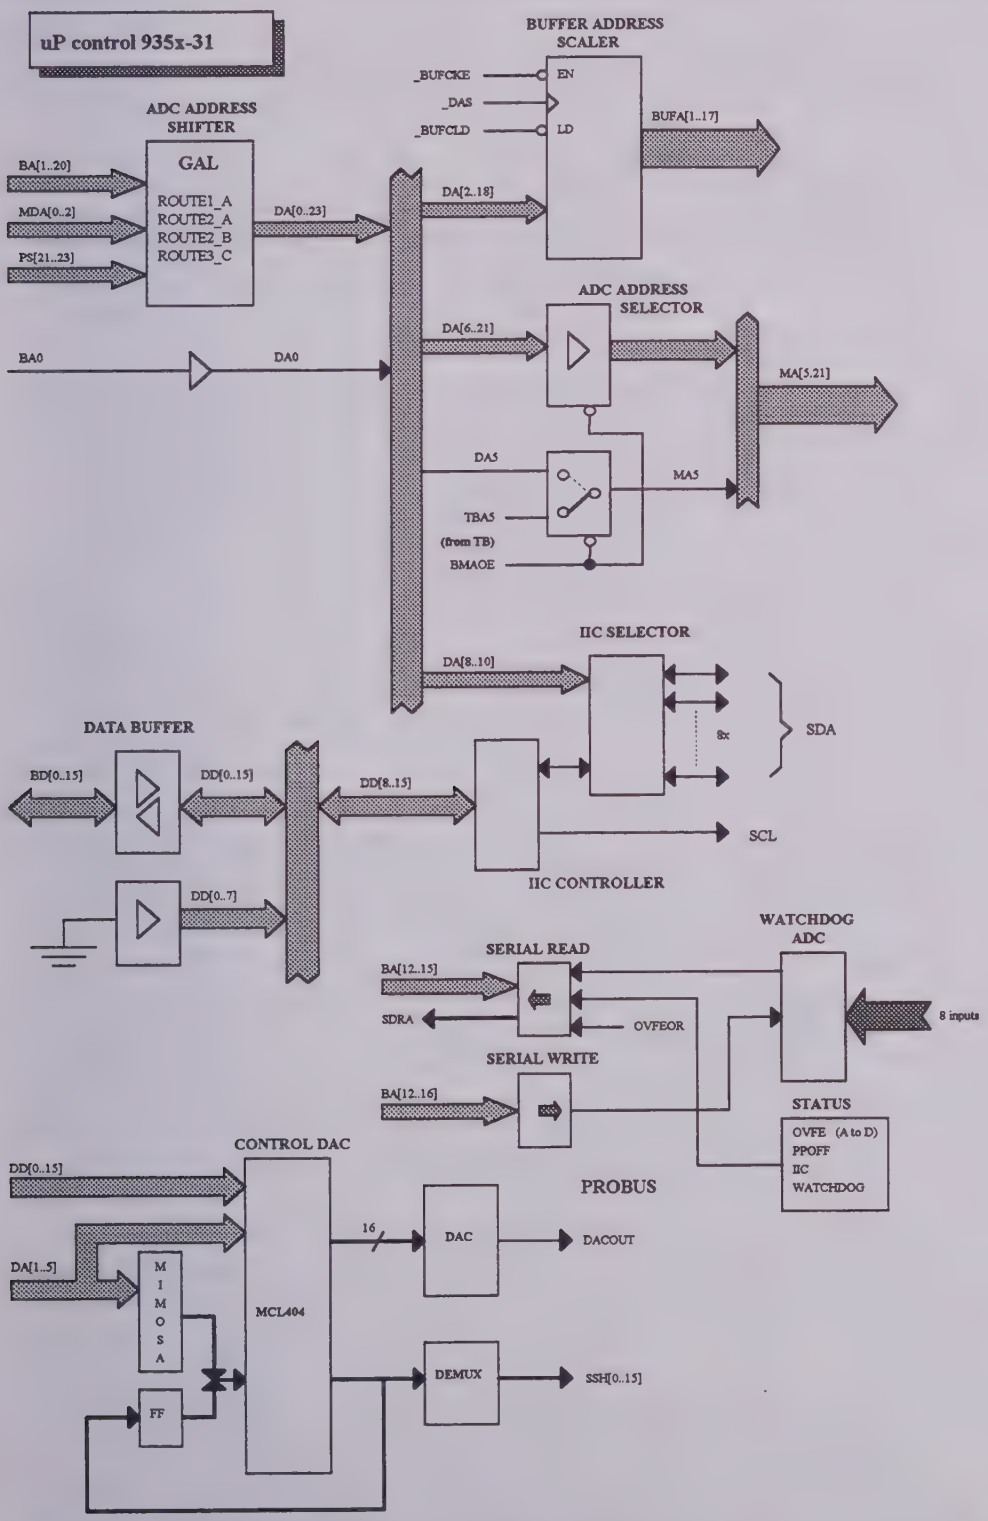
The data bus BD(0:15) from the microprocessor is buffered by A12 and A14 to unload the microprocessor bus from the extended bus DD(0:15) on the acquisition card. There is a one to one mapping of the two busses. All data flows through this bi-directional bus buffer. An additional eight bit buffer (A27) provides zero fill for the least significant eight bits of the bus when the processor reads data from the acquisition or buffer memory.

Bus	Bus name	Description
BD(0:15)	Data bus	Microprocessor data bus, bi-directional
DD(0:15)	Internal data bus	Internal buffered microprocessor data bus, bi-directional

4.2.2.2 ADC Address Shifter

Four GAL16V8's, ROUTE1-A, ROUTE2-A, ROUTE2-B, and ROUTE3-C shift and buffer the address bus BA(0:31) from the microprocessor. The shifted address bus DA(0:31) is used to read the data from the acquisition memory and the buffer memory.

Data from the four acquisition channels are not written into the acquisition memory in a linear sequential fashion. For example, when interleaving channel 1 and channel 2 for a sample rate of 2 Gs/S, channel 1 acquisition memory has the first sample point and channel 2 has the second sample point, these must be read in the correct time sequence to the microprocessor. The address bus shifter is programmed to read the first sample point from channel 1 and the second from channel 2, etc. Similarly, when 4 Gs/S is selected, one sample from each channel is read in the correct time sequence for the microprocessor



Each channel also interleaves two ADC's to sample at 1 Gs/S. At this sample rate two demultiplexers write sample points to memory in a non time ordered sequence. The

address shifter must shift the microprocessor address bus to read the sample points in the correct time sequence.

Bus	Bus name	Description
BA(0:31)	Address bus	Address bus from the microprocessor
DA(0:31)	Shifted address bus	Acquisition memory bus and when selected, the buffer memory address bus

4.2.2.3 Buffer Address Scalar

Acquisition memory is off-loaded to the buffer memory via the MDX622 demultiplexers for direct access by the microprocessor. The buffer memory is sequentially addressed via the address bus BUFA(1:17) by the buffer address scalar, a seventeen bit counter. The buffer address scalar can be loaded with an address pointing to the start of data, then sequential address strobes from the microprocessor increments the scalar, sequentially addressing the buffer memory and writing waveform data. Meanwhile the address shifter reads the waveform data from the acquisition memory in the correct time sequence.

Bus	Bus name	Description
BUFA(1:17)	Buffer address bus	Address bus for the buffer memory which stores a portion of the acquisition memory data.

4.2.2.4 ADC Address Selector

After the acquisition memory is filled by the waveform data, the buffer address scalar is loaded with the starting address for the buffer memory and the shifted address bus is connected to the acquisition memory address bus MA(5:22) with the ADC address selector. (NOTE: During acquisition, the monolithic timebase, MTB411, provides the memory addresses.) Sequential addresses from the microprocessor address the acquisition memory and increment the buffer address scalar, moving the waveform data from the acquisition memory to the microprocessor card. The buffer memory snoops the data and saves the waveform data from the acquisition memory in the local buffer memory. Subsequent accesses to the waveform data by the microprocessor can come from the buffer memory instead of the acquisition memory. The buffer memory stores only 128k samples, one eigth of the samples stored in the acquisition memory. At memory sizes above this value, double buffering in the buffer memory is of little use.

Notice that the buffered sample points are in the correct time sequence for single channel operation. However, when two or four channels are interleaved, the address shifter must be used to read the data from the buffer memory in the correct time sequence for the microprocessor.

Bus	Bus name	Description
MA(5:22)	Memory address	High speed acquisition memory address bus

4.2.2.5 Decode Logic

A programmable device, GAL16V8, called AVENUE-A decodes the upper address bits of the microprocessor address bus to generate the signals shown below.

AVENUE-A	
SPER0, SPER1	select peripheral group
PS21, PS22, PS23	pseudo address output for the address shifter
_EBA	select card
_SMDX	select MDX

Two more GAL16V8's (CHEMIN-A and ARTERE-A) use the output of AVENUE-A, part of the shifted address bus (DA(0:31)), and the microprocessor signals _BAS and _BR_W to write and read the acquisition memory and buffer memory.

The decoded signals of these two decoders are:

CHEMIN-A	
_BUFCLD, _BUFCKE	buffer scalar command output
_WEBUFH, _WEBUFL, _BUWALL	buffer memory command output
_EADR_AB, _EADR_CD, DIOE	ADC command
ARTERE-A	
_EZERO, EADCW	driver command
_SADCM, _ADCOE1, _ADCOE2	ADC memory command output
_WE_AB, _WE_CD	ADC write output
_REBUF	buffer READ output

Another GAL16V8 (MIMOSA-A) is the state machine for the scanning DAC.

The following table is the memory map for the F9384-31 card.

ADC memories (0200 0000 - 0200 FFFF) 16MB			
0200 0000	**021F FFFF**	ADC memory ch. A 1MP	2MB
	023F FFFF	ADC memory ch. A 2MP	4MB

0350 0000	0357 FFFF	BUF memory ch. B 2x128kB	512kB
0360 0000	0367 FFFF	BUF memory ch. C 2x128kB	512kB
0370 0000	0377 FFFF	BUF memory ch. D 2x128kB	512kB
Spare (0380 0000 - 03FF FFFF) 8MB			
0380 0000	03FF FFFF	spare	12MB

4.2.2.6 Serial, Watchdog ADC, Overload, and IIC Control

The microprocessor card provides the serial clock SCKA, write data SDWA, and strobe STRA for the serial data stream that programs most of the DAC's and registers. It reads back the serial data via SDRA. Two decoders (A4 and A10) provide 13 write strobes, generated by STRA. The data is shifted in from the microprocessor to all of the serial DAC's and registers but only the intended DAC's or registers are strobed by the write strobe.

The LC574A has controls for the gain of each flash and delay and offset of each S/H for each channel, a total of six DAC's per channel. These DACs are provided by three octal 8-bit DACs.

The watchdog ADC monitors probe attenuation, calibration voltage, and VCCADC and generates an interrupt when any monitored voltage is outside of the valid range. Attaching a probe to the input of the scope changes the monitored voltage and alerts the microprocessor that a new probe is connected. The probe is interrogated by the microprocessor to determine the type of probe.

An overload condition at any of the 50 ohm inputs generates an interrupt to the microprocessor. The microprocessor reads the status register to determine which of the 8 possible overload conditions caused the interrupt.

The probus connectors are controlled by the IIC controller and IIC selector. IIC is a two wire serial bus used to control the probus probes. The controller controls the four input channels, external trigger input, probe cal, an EEPROM, and another input.

4.2.2.7 Scanning DAC

The scanning DAC is an 18 channel 16 bit DAC for use where precision and resolution are needed in the analog circuits. The DAC output range is +/-10 volts. It has its own reference and is not trimmed for gain or offset.

The MCL404 is a controller chip for the scanning DAC subsystem. Eighteen sample and hold circuits can be updated periodically with the MCL404. The MCL404 sequentially enables each of the sample and hold circuits. A precision 16 bit DAC provides the input to the sample and hold circuits through an analog multiplexer also controlled by the MCL404. The MCL404 has eighteen internal 16 bit registers for the eighteen sample and hold circuits.

Each frontend channel has a gain, offset, and trigger level sample and hold. External trigger level is connected to one sample and hold. Probe calibrate also uses one of the sample and hold outputs.

The scanning DAC is not used to calibrate the S/H and flash gain, offset, and delay. These are independent DAC's near each acquisition hybrid.

4.2.2.8 Power Supply Connector

The power supply provides +/-15 volts, +/-6 volts, +/-5 volts, +3.3 volts, -2 volts and line. All voltages except for line appear at connector J2. Line appears on connector J4. Line is a TTL compatible square wave synchronized to the ac power supplying the instrument.

4.2.3 Front End

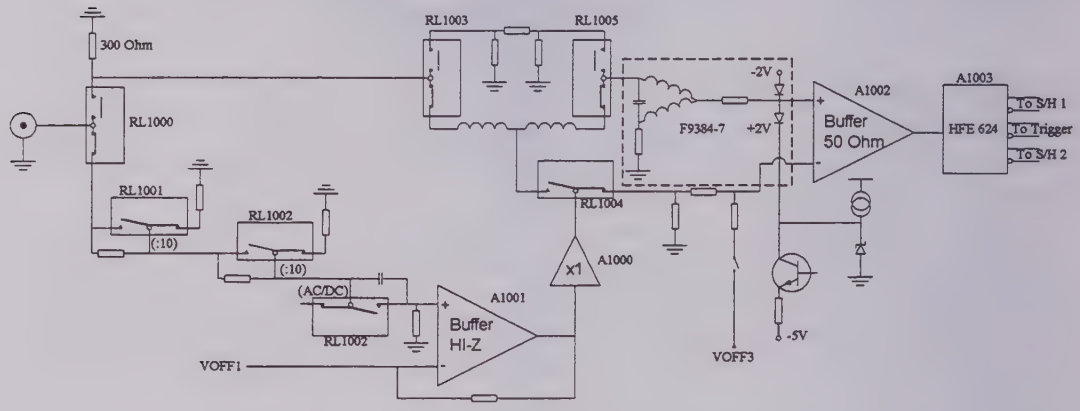
The front end system provides the signal conditioning for the ADC system.
The main functions are :

- four channel operation, calibration with software control
- input protection and coupling : AC, DC, 1 MΩ, 50 Ω
- amplitude normalisation for the ADC system : 320 mV full scale
- fine gain control
- offset control
- bandwidth limit filter : BWL 25 MHz or 200 MHz user selctable
- triggering with standard coupling and TV trigger on four channels and External

Six power supplies are generated from +/-15 volts and +/-6 volts for use in the frontend. These are: +/-12VFEP, +/-12VFE, and +/-5VFE. A reference supply VREF at 5 volts is generated by an SMLM336-5 from +12VFE.

4.2.3.1 Channel Description

The four channels are identical, thus only one channel will be described for brevity.



Attenuation/Coupling Stage

- Relay RL1000 selects the input between the **HiZ** (1 MΩ) and the 50 Ω path. A diode circuit senses the temperature of the 300 Ω termination and sets the _OVL bit low if overheating is detected. If overload is detected the 50 Ω path is then disconnected by the hardware and the 1 Mohm input is switched in.
- Relay RL1001 selects the input between divide-by-10 or direct for the signal in the **HiZ** path.
- Relay RL1002 selects another divide-by-10 or direct for the signal in the **HiZ** path
- Relay RL1003 selects the input between another divide-by-10 or direct for the signal in the 50 Ω path.
- Relay RL1004 enables the **HiZ output** (selection between 1MΩ output & offset for 50 Ω buffer).
- Relay RL1006 sets the AC/DC coupling in HiZ.
- Relay RL1007 selects the ouput between no attenuation in 50 Ω or HiZ (if RL5 is ON) to attenuate by 10 in 50 Ω.
- Switch SW1 (_Voff3) enable :This signal is only used for the calibration of the 50 Ω path when 1 MΩ coupling.

HFE624:

The HFE624 provides the following functions:

- Fine gain control to fill up the fixed vertical sensitivities with a 13:1 gain control range
- Bandwidth limit filter at 25 MHz and 200 MHz
- Three outputs, one for the trigger circuit and two for sample and hold input.
- Amplitude normalisation for the ADC system : at the BNC the dynamic range is 16 mV to 8V FS at 50 Ω and to 80V FS (full scale) at 1 MOhm in a 1-2-5 step sequence and the ADC system input is 500 mV differential,

4.2.3.2 Digital controls

The following controls are for the front end in the 9354. Note: Bits 16-23 are internal to the HFE624 and are written as a serial data stream.

0141 0z00 - 0141 0zff write channel A control register
0141 1z00 - 0141 1zff write channel B control register
0141 2z00 - 0141 2zff write channel C control register
0141 3z00 - 0141 3zff write channel D control register

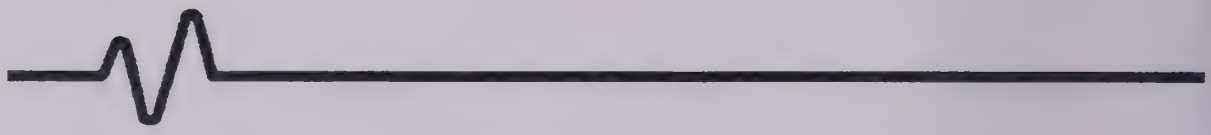
_PPOFF probe power overload interrupt,
_OVL_noverload indicator (Ch A, B, C, D, EXT).



OPT935XA-CKTRIG option package (9th bit of serial read).

A low state indicate that overload or interrupt is detected. Bit OPT is high when the options are available.

0140 5z00 - 0140 5zff read overload sum

OVLSUMbit 7, Sum of the eight above bits.
0 = OK, 1 = problem occurred (read channels overload)

4.2.3.3 Analog controls

- One precision DAC, with its associated control system, drives and refreshes a multiple sample-and-hold system. Each channel has three analog controls VOFF1_x, VOFF3_x and IVGAIN_x, where x refers to channel A, B, C, or D corresponding to channels 1, 2, 3, and 4. VOFF1_x is the offset control in 50 Ohm coupling,, VOFF3_x is used to control the offset of the 50 Ohm path when in 1 MOHm coupling and IVGAIN_x is used to calibrate the gain of the front end and perform the variable gain control.
- The DAC dynamic range (± 10V) is scaled to the proper range by means of resistor dividers.

The addresses are :

0300 0000	write channel A gain control
0300 0002	write channel A offset control
0300 0004	write channel B gain control
0300 0006	write channel B offset control
0300 0008	write channel C gain control
0300 000a	write channel C offset control
0300 000c	write channel D gain control
0300 000e	write channel D offset control

4.2.4 Trigger

The different trigger couplings are :

- DC
- AC : cut off frequency approximately 10 Hz.
- LF REJ: a single pole high pass filter with a cut off frequency at 50 kHz.
- HF REJ: a single pole low pass filter with a cut off frequency at 50 kHz.
- HF: divides the trigger frequency by two.

The amplitude at the input of the MTR408 is approximately 400 mV FS (identical to the ADC system),

4.2.4.1 Digital Controls

The 40 bit shift register, is allocated as follows :

0141 4z00 - 0141 4zff write trigger control register

39							32
—	TBWL_A	HFR_A	AC_A	DC_A	—	SNEG_A	SPOS_A
31							24
TEXT50	TBWL_B	HFR_B	AC_B	DC_B	—	SNEG_B	SPOS_B
23							16
—	TBWL_C	HFR_C	AC_C	DC_C	—	SNEG_C	SPOS_C
15							8
—	TBWL_D	HFR_D	AC_D	DC_D	—	SNEG_D	SPOS_D
7							0
_EXT/10	TBWL_EXT	HFR_EXT	AC_EXT	DC_EXT	—	SNEG_EXT	SPOS_EXT

TEXT50 0 = 1 MΩ external input coupling, 1 = 50 Ω external input coupling.

_EXT/10 0 = attenuation is ON, 1 = OFF.

4.2.4.2 Analog Controls

A sample and hold fed by the precision DAC provides the threshold level.

The addresses are :

0300 0010	write EXT threshold control
0300 0018	write channel A threshold control
0300 001a	write channel B threshold control
0300 001c	write channel C threshold control
0300 001e	write channel D threshold control

4.2.4.3 TV Trigger

Each channel has an analog pick-off for the tv trigger after the HFE624. The external trigger has a pickoff after the high impedance buffer. The TV trigger source is selected via the three bits of TVS and drives an amplifier with complementary outputs. These outputs are selected by _TVINV.
The TV trigger uses a commercial chip (LM1881) and provides two outputs,TV1 & TV2. This circuit is able to trigger on several different TV line number standards.

- **Digital Controls**

The 16 bit shift register, written using the serial protocol, is allocated as follows :

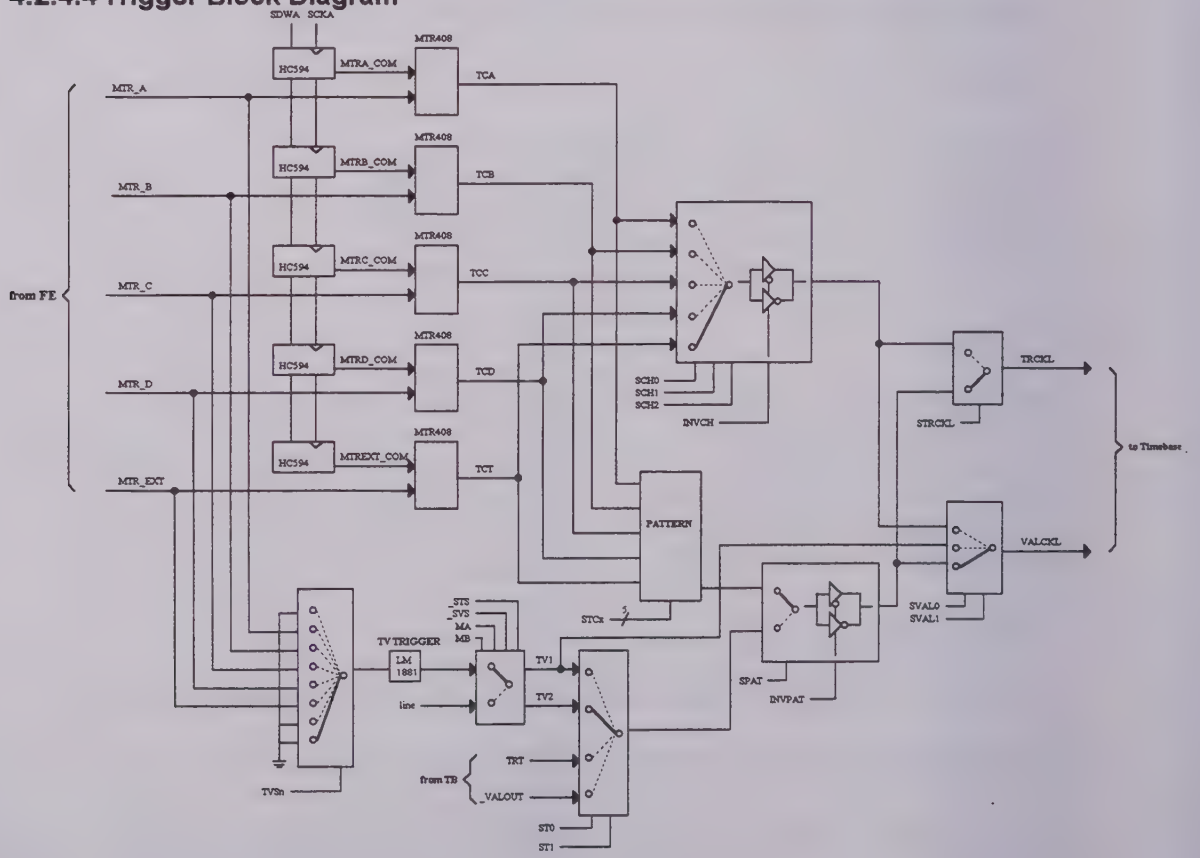
0141 5z00 - 0141 5zffwrite trigger TV and MST412 oscillator control register

15							8
_TVINV	TVS2	TVS1	TVS0	HDTV	875	MB	MA
7							0
_STI	_STW	_SVS	STS	—	—	—	—

_TVINV 0 = inverting TV trigger (to compensate for inversion in MFE409).
_SVS 0 = enable TV1 source.
_STS 0 = enable TV2 source.
_STI 0 = enable interval width mode for MST412 oscillator control.
_STW 0 = enable pulse width mode for MST412 oscillator control.

TVS2	TVS1	TVS0	TV trigger source	HDTV	875	line setting
0	0	1	channel A	0	0	525-625 TVLO
0	1	0	channel B	0	1	875 (MED)
0	1	1	channel C	1	0	1225 (HIGH)
1	0	0	channel D	1	1	2500 (HDTV)
1	0	1	external trigger			

4.2.4.4 Trigger Block Diagram



4.2.5 Analog to Digital Converter

4.2.5.1 Introduction

The analog to digital converter system does the signal conversion to 8 bits. Each channel has a custom hybrid, HAD621, that contains two identical channels A and B consisting of a sample and hold, MSH417, and an ADC, TDA8718. Each hybrid is followed by a data demultiplexer, MDX622 and memory.

- Sample and Hold : the MSH417 with an analog bandwidth of 1GHz, performs the track and hold before the ADC. It is clocked at three different frequencies : 500 MHz, 400 MHz, and 200 MHz. The offset difference between the two channels in the HAD621 is adjusted by an 8 bit DAC.

- Flash ADC : the TDA8718 is a folding ADC working at a maximum clock speed of 500 MS/s. The gain difference between channels in the HAD621 is calibrated by adjusting the internal resistor ladder using an 8 bit DAC. The ADC input level is nominally 2 volts peak to peak.

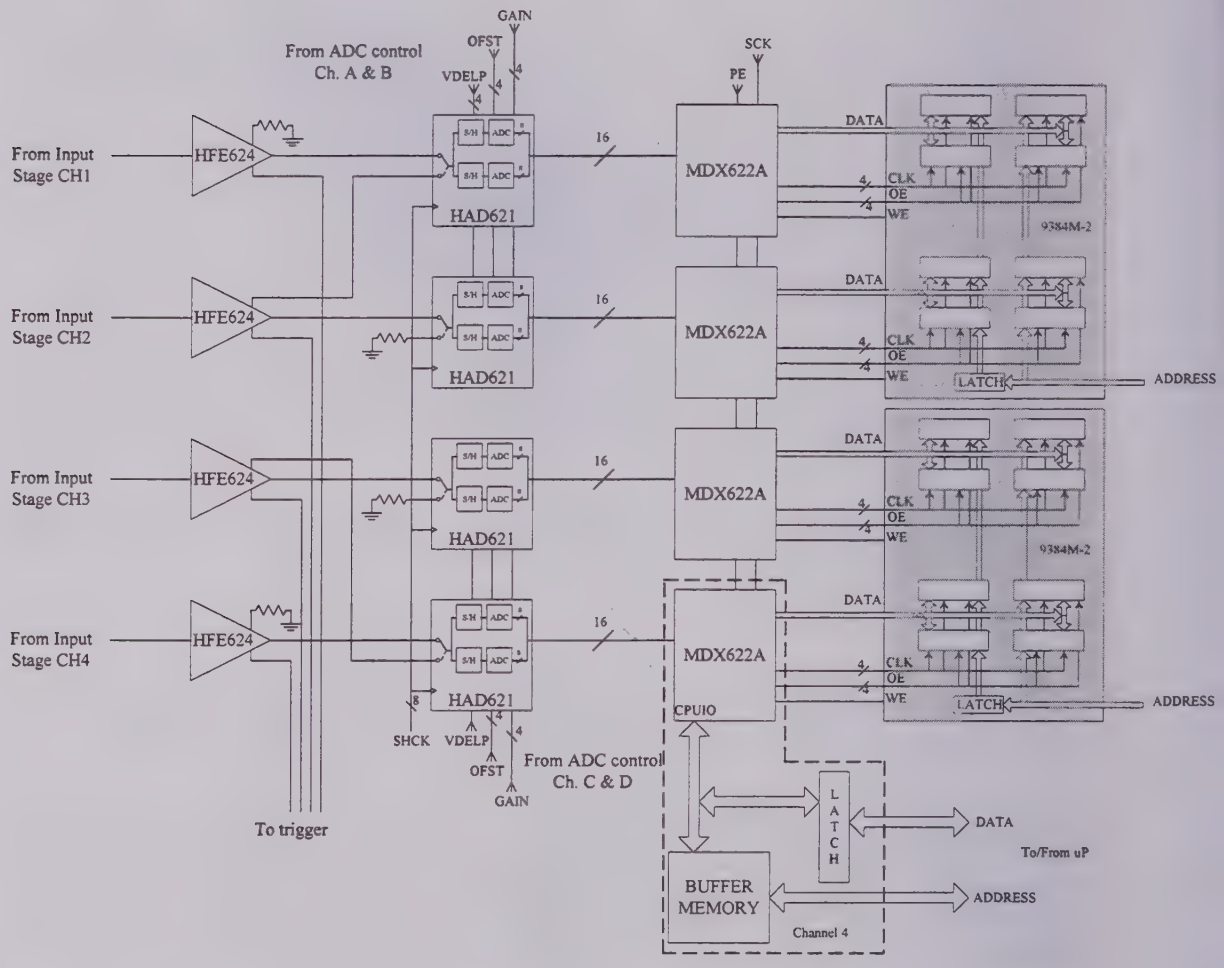
- Demultiplexer : the MDX622 monolithic is used to demultiplex the ADC output for the slower memories and to peak detect the data on the fly.

- Buffer Memory : 128K bytes

- ADC Memory : 100 K for the LC574A, 500 K for the LC574AM and 2 M for the LC574AL. Memory length may be extended by combining the acquisition memories of multiple channels to a maximum of 8 Mpoints for one channel.

Any time two channels are interleaved to produce a higher sample rate, the timing between the S/H's must be precise. A square wave oscillator at a frequency of 15.5029 MHz provides the edge required to calibrate the timing. The square wave is injected into the 50 ohm signal path at the buffer driving the HFE624 and is used by the software to calibrate out this internal delay.

4.2.5.2 ADC/Memories Block Diagram



4.2.6 Time Base

4.2.6.1 Introduction

The main clock comes from a PLL oscillator that uses a precision 10 MHz reference. There is a control bit, SEXTREF, to select an optional external reference providing a 0 dbm signal level.

The PLL output frequency is controlled by three bits, SF500, SF400, and _SF200. One branch of the main clock, SHCK, is directly used by the sample-and-hold, the analog-to-digital converter and the time-to-digital converter for data acquisition. A differential ECL clock from each channel, called MCK, synchronizes the MDX622 data demultiplexer with the data from the ADC.

Another branch of the main clock, MDXCK, is routed to the time where the basic timing of the oscilloscope is generated. A programmable divider using a fast ECL first stage and a slower TTL second stage generate a signal called SAMPLE CLOCK. A second programmable ECL divider uses SAMPLE CLOCK to generate the timing signals for the MDX622 data demultiplexers, the time to digital converter, the trigger recognizer, and the MTB411 timebase.

The main clock can also be driven from the external trigger BNC, this path is selected by a control bit (SEXTCK). The external clock threshold can be modified by two bits from the time base mode control (EXTCTH1 and EXTCTH2). This external clock frequency range is 0 to 100 MHz. An optional rear panel input can drive the external clock to 500 MS/s.

The PLL oscillator has in fact only two values, 500 and 400 MHz, the 200 MHz is a secondary path coming from a divide by two.

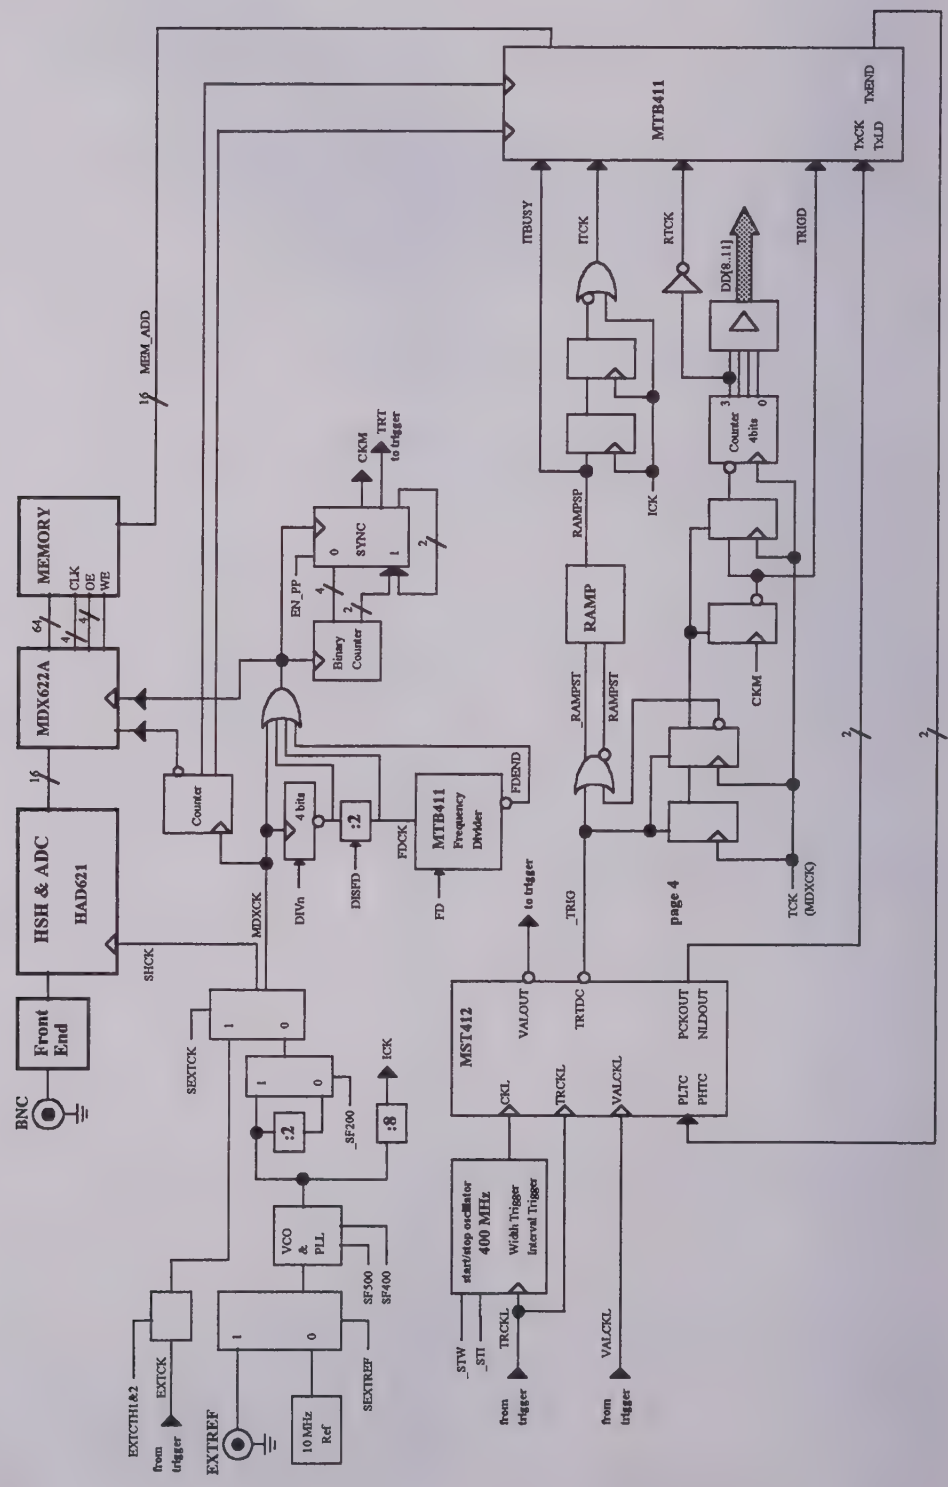
- 500 MHz is used for the fast timebase settings, 250 MS/s, 500 MS/s, 1 GS/s, 2 GS/s, 4 GS/s and RIS mode.

- 400 MHz is used for all other timebase settings including Roll mode.

The time to digital converter is a variation on the classic Wilkinson charge to time converter. The capacitor is charged by the time difference between the trigger and the main clock, while the discharge is controlled by a fixed current source approximately 0.001 times the charging current. The MTB411 counts a clock called ICK, which is 1/8 th. of the main clock, during the discharge part of the TDC. The value of the counter after the discharge cycle is proprotional to the time difference.

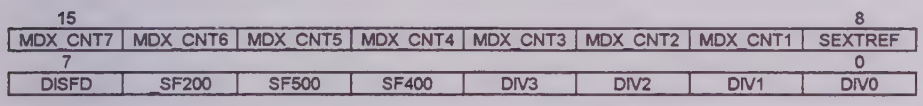
Another clock called TRT, derived from the main clock is used by the processor to calibrate the smart trigger.

4.2.6.2 Time Base Block Diagram



4.2.6.3 Digital Control

0141 8z00 - 0141 8zffwrite Time Base divider register



where :

- SEXTREF select optional external PLL clock reference (10 MHz ± 5 %).
- DISFD disable FD clock to MTB411.
- _SF200 select oscillator frequency 200 MHz.
- SF500 select oscillator frequency 500 MHz.
- SF400 select oscillator frequency 400 MHz.
- DIVn frequency pre-divider (4 bits).
- MDX_CNT1:7 master MDX622 divider.

4.2.6.4 Trigger Selection

Each differential output of the five MTR408's from the Front-End (TCx) are selected (bit SCHn) and then inverted (bit INVCH) to drive the TRCKL signal and the VALCKL signal (bit SVAL1).

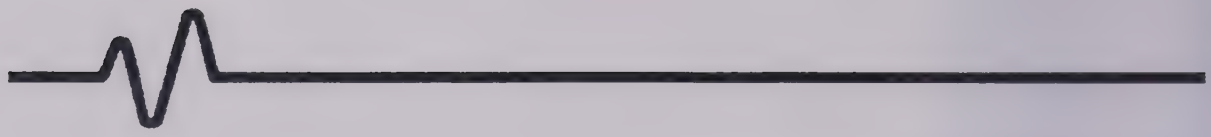
A logical function of the TCx signals can be selected (bit STCx) for the pattern generator. A few single ended signals can also be selected one at a time (bit STn). These signals are TV1 and TV2 for television trigger, TRT for test and calibration of MST412, _VALOUT for drop-out trigger.

Then there is a selection between the pattern and the single ended sources (bit SPAT). The signal obtained is inverted (bit INVPAT) and used to drive TRCKL (bit STRCKL). There is also a choice between this signal and TV1 to drive VALCKL (bit SVAL0). The pattern trigger logic function is any "AND" combination of TCx input signals, inverted or not. All the controls are done through a 16 bit serial register.

4.2.6.5 Smart Trigger

The VALCKL source drives the MST412. The TRCKL source goes through a buffer to drive the MST412, the fast trigger latch, and control the smart trigger 400 MHz start/stop oscillator. The DC trigger coupling mode uses the fast trigger latch path for triggering to approximately 700 MHz. Selecting HF trigger coupling extends the trigger sensitivity to beyond 1 GHz.

The MST412 oscillator is usually free running, but when using glitch trigger mode, the oscillator is enabled only during the pulse duration (bit _STW), and when using interval width trigger mode the oscillator is restarted at each edge (bit _STI).
There is also a time base mode control register with roll mode interrupt enable (RMIE), external clock control (SEXTCK, EXTCTH1 and EXTCTH2), buzzer (BUZZ) and calibration front panel output signal selection (PCSn).



4.3 F9300-4 GPIB and RS 232 Interface

This board is connected to the processor through a flat cable.
Data bus is 8 bits, address bus: 12 bits.
Address 0180 000 to 0180 00FF.

4.3.1 RS 232 Serial Interface

Based on the 2661A IC from Signetics or Philips.

- Clock frequency 4.9152 MHz.
- RTC/CTS signals are connected
- DCD input is biased and the DTR output is not wired
- 4 internal registers of 8 bits.
- Interrupt level 2.
- Connector compatible with a DB9-P (9 pin male).

4.3.2 GPIB Interface

Based on the circuit 7210 IC from NEC.

- Clock frequency 4.9152 MHz.
- 8 internal registers of 8 bits.
- Tri-state external GPIB drivers. - Low level output.
- Interrupt level 3.

The GPIB address is set by software and stored in non-volatile memory.

4.4 FP9604 Front Panel

The front panel is connected to the processor board with a flat cable. Power supply and control signals are supplied from the processor. The front panel is divided in two sections:

- F9604-5 board with Motorola 68HC05C4 processor, encoders, and serial data interface.
- F9602-5 matrix keypad with push buttons.

4.5 F9300-7 Printer Controller Option

- Based on the Internal graphic printer LPT5446, and LPT5000 series control chip set from Seiko instrument Inc (Technical reference 39019-2234-01)
- PT501P01 CPU
- PT500GA1 Gate array
- Address 0130 0100
- Interrupt level 2

4.6 PSLC574 Power Supply

Line Voltage Autoranging

The LC574A oscilloscope operates from a 115 V (90 to 130 V) or 220 V (180 to 260 V) normal power source at 47 Hz to 63Hz. No voltage selection is required since the instrument automatically adapts to the line voltage which is present. The instrument operates at line frequencies up to 440 Hz.

4.6.1 Power Supply Specifications

Input voltage : 90 to 130 V or 180 to 260 V.
Auto ranging line voltage.

Input frequency : 47 Hz to 63 Hz.

Input rush current : Max. 40 A peak at start up.

Environmental : Operating temperature range 0 °C to + 50 °C
Storage temperature range - 55 °C to + 80 °C
Relative humidity from 5% to 95%.

Output voltages : - 5.2 VDC, 13 amp Max.
+ 5.2 VDC, 6 amp Max.
- 15.1 VDC, 3 amp Max
+ 15.1 VDC, 3 amp Max.
- 2.1 VDC, 10 amp Max.
+ 3.3 VDC, 3 amp Max.

Output adjustment : +/- 5%.
Regulation : +/- 1%.

Transient response : recover to 1% of its final value within 500 μsec.

Ripple and noise : Peak to peak value < 50 mV

Hold up time : 16 msec at full load

Output short circuit protection : Yes.

Output over voltage protection : Yes.

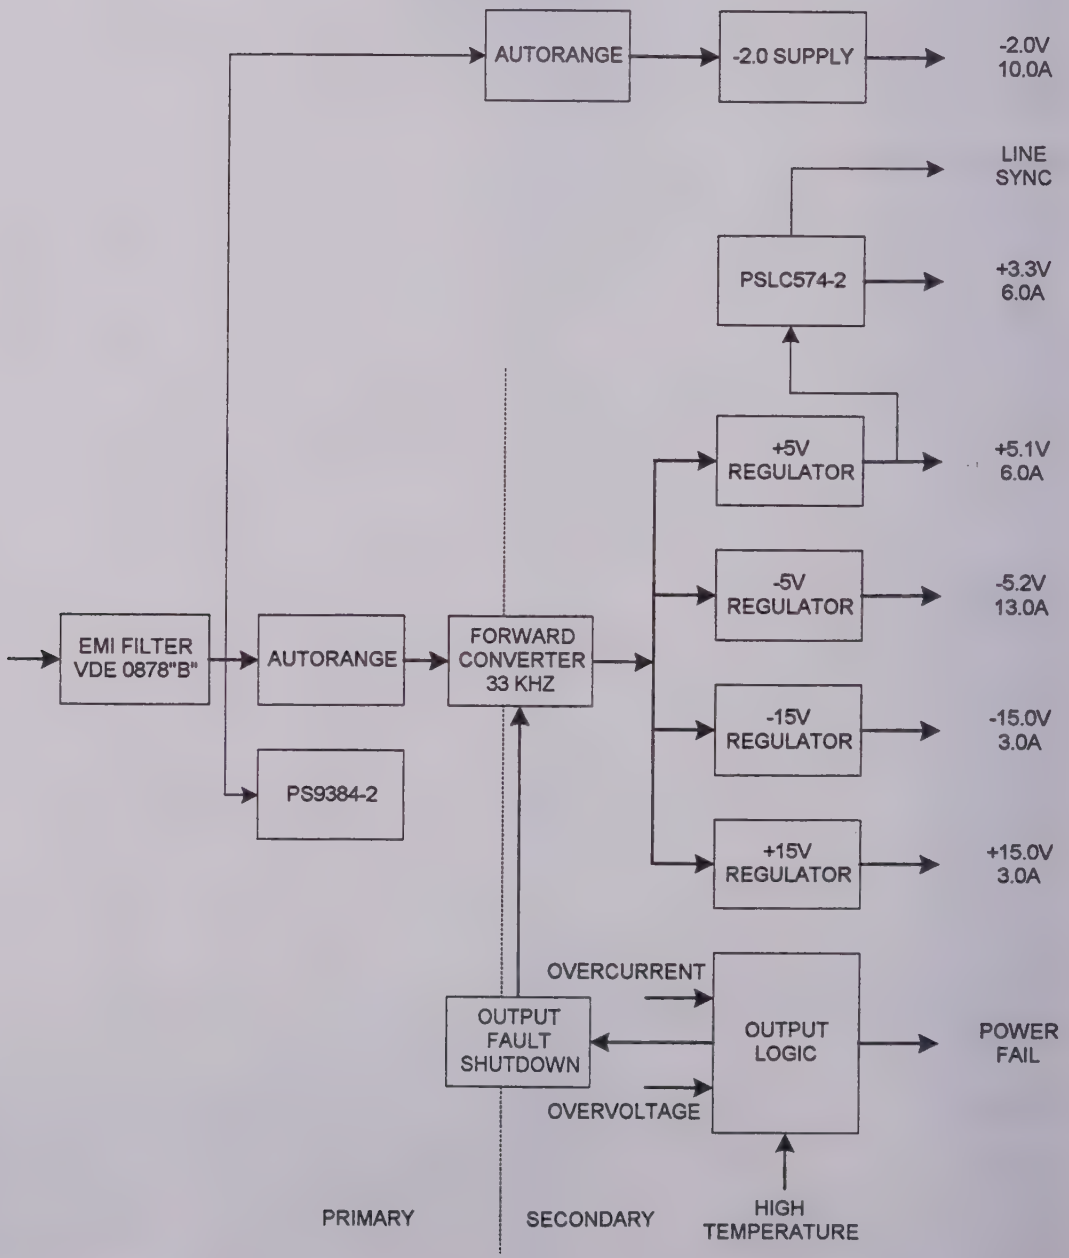
Input protection : 6 amp fuses.
Thermal protection : Yes.

Safety : VDE 0806, IEC 380, 435, 950 & UL1012, 478, CSAC22.2#1402C
EMI : VDE 0871 class A, FCC 20780 class A.

4.6.2 Power Supply Configurations

There are two different power supplies which may be present in the LC574A. They are the PSLC574 and the 900024. The 900024 has a fan on the front of the power supply while the PSLC574 does not. The presence of a fan is based on the type of fan used in the rear of the unit.

4.6.3 Power Supply Block Diagram



5. Performance Verification Procedures

5.1 Introduction

This chapter contains procedures suitable for determining if the LC574A Digital Storage Oscilloscope performs as warranted.
They check all the characteristics that are designated as specifications in subsection 5.1.1.

Because they require time and suitable test equipment, you may not need to perform all of these procedures, depending on what you want to accomplish.

In the absence of the computer automated calibration system based on LeCroy Calibration Software (LeCalsoft), this manual performance verification procedure can be followed to establish a traceable calibration.
It is the calibrating entities' responsibility to ensure that all laboratory standards used to perform this procedure are operating within their specifications and traceable to required standards if a traceable calibration certificate is to be issued for the LC574A Digital Storage Oscilloscope.

5.1.1 List of Specifications

The electrical specifications described in terms of quantifiable performance limits are listed in this subsection.

- Input Impedance
- Leakage Current
- Peak to Peak and RMS Average noise level
- Positive and Negative DC linearity
- Positive and Negative Offset
- Bandwidth
- Trigger Level
- Smart Trigger
- Time Base Accuracy
- Overshoot and Rise Time
- Overload

5.1.2 Calibration Cycle

The LC574A Digital Storage Oscilloscope requires periodic verification of performance. Under normal use (2,000 hours of use per year) and environmental conditions, this instrument should be calibrated once a year.

5.2 Test Equipment Required

These procedures use external, traceable signal generators, DC precision power supply, step generator and digital multimeter, to directly check specifications.

Instrument	Specifications	Recommended
Signal Generator Radio Frequency	Frequency : .5 MHz to 2 GHz Frequency Accuracy : 1 PPM	HP8648B or equivalent
Signal Generator Audio Frequency	Frequency : 0 to 5 KHz Amplitude : 8 V peak to peak	LeCroy LW420 or HP33120A or equivalent
Voltage Generator DC Power Supply	Range of 0 to 20 V, in steps of no more than 15 mV	HP6633A or equivalent
Step Generator Fast Pulser	Rise time 350ps ± 100 ps Overshoot 3.5 % ± 1 %	LeCroy 4969A + PB049 or equivalent
Power Meter + Sensor	Accuracy ±1 %	HP436A + 8482A or equivalent
Digital Multimeter Volt & Ohm	Voltmeter Accuracy : 0.1 % Ohmmeter Accuracy : 0.1 %	Keithley 2000 or equivalent
Adapter	50Ω to 1MΩ	LeCroy 4962-9
Adapter	4 GS/s, Single channel mode	LeCroy PP094
Coaxial Cable, 1 ns	50Ω, BNC, length 20 cm,	LeCroy 480232001
Coaxial Cable, 5 ns	50Ω, BNC, length 100 cm,	LeCroy 480020101
Attenuators, 20 dB	50Ω, BNC, 1 % accuracy, 2GHz	LeCroy 402200402
Terminator, 2 W	50Ω, BNC, Feed-Through	LeCroy 402323001
T adapter	50Ω, BNC T adapter	LeCroy 402222002

Table 5-1 : Test Equipment

5.2.1 Test Records

The last pages of this chapter contain LC574A test records in the format tables. Keep them as masters and use a photocopy for each calibration.

5.3 Turn On

If you are not familiar with operating the LC574A, read the operator's manual.

- Switch on the power using the power switch.
- Wait for about 10 minutes for the scope to reach a stable operating temperature, and verify :

* the display turns on after about 10 seconds and is stable.
* the range of intensity and grid intensity is reasonable.

5.4 Input Impedance

Specifications

DC 1.00 MΩ ±1 %
DC 50Ω ±1 %

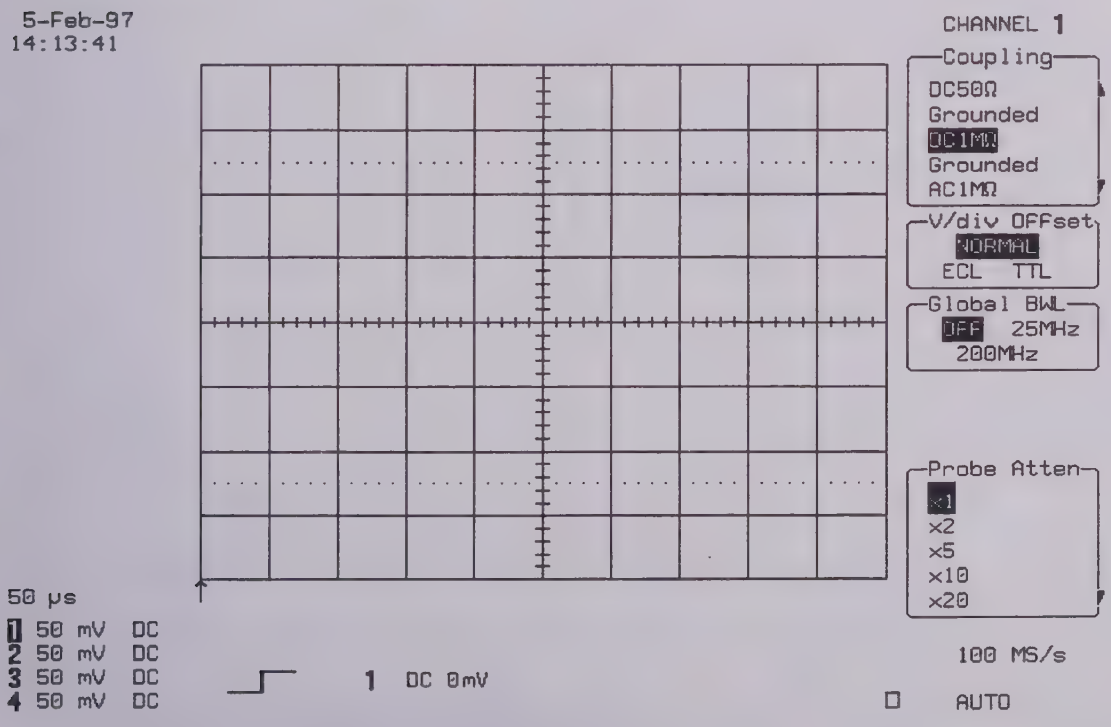
The impedance values for 50Ω, 1MΩ and Gnd couplings are measured with a high precision digital multimeter. The DMM is connected to the DSO in 4 wire configuration (input and sense), allowing for accurate measurements.

5.4.1 Channel Input Impedance

a. DC 1MΩ

- Recall **574p001.PNL** or configure the DSO :

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channels Trace OFF		**Channel 1, Channel 2, Channel 3 & Channel 4**
Input Coupling	:	**DC 1MΩ** on all 4 Channels
Input gain	:	**50 mV/div.** on all 4 Channels
Time base	:	**50 µsec/div.**
Trigger mode	:	**Auto**

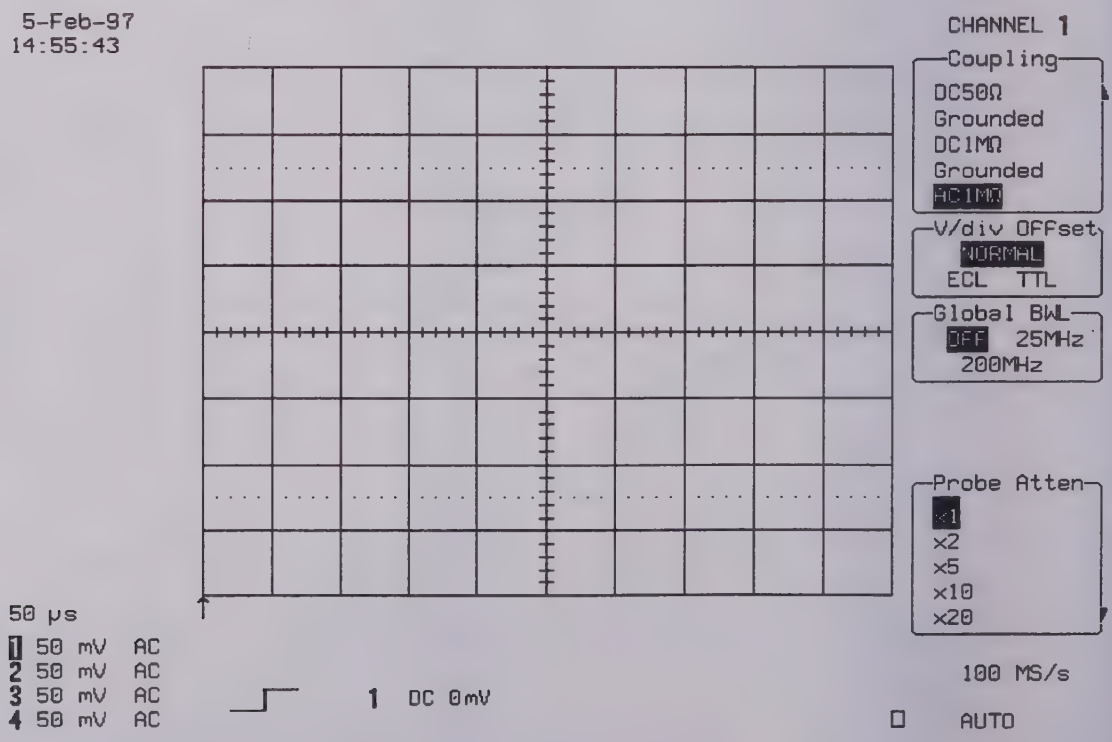


- Set the DMM with **Ohms and Ohms sense** to provide a 4 wire measurement.
- Connect it to Channel 1.
- Measure the **input impedance**. Record it in Table 2, and compare it to the limits.
- Repeat the above test for all input channels.
- Recall **574p002.PNL** or Set Input gain to **200 mV/div.** on all 4 Channels
- Repeat the test for all input channels.
- Record the measurements in Table 2, and compare the test results to the limits in the test record.

b. AC 1MΩ

- Recall **574p003.PNL** or configure the DSO as shown in 5.4.1.a, and for each Channel make the following change :

  Input Coupling : **AC 1MΩ**



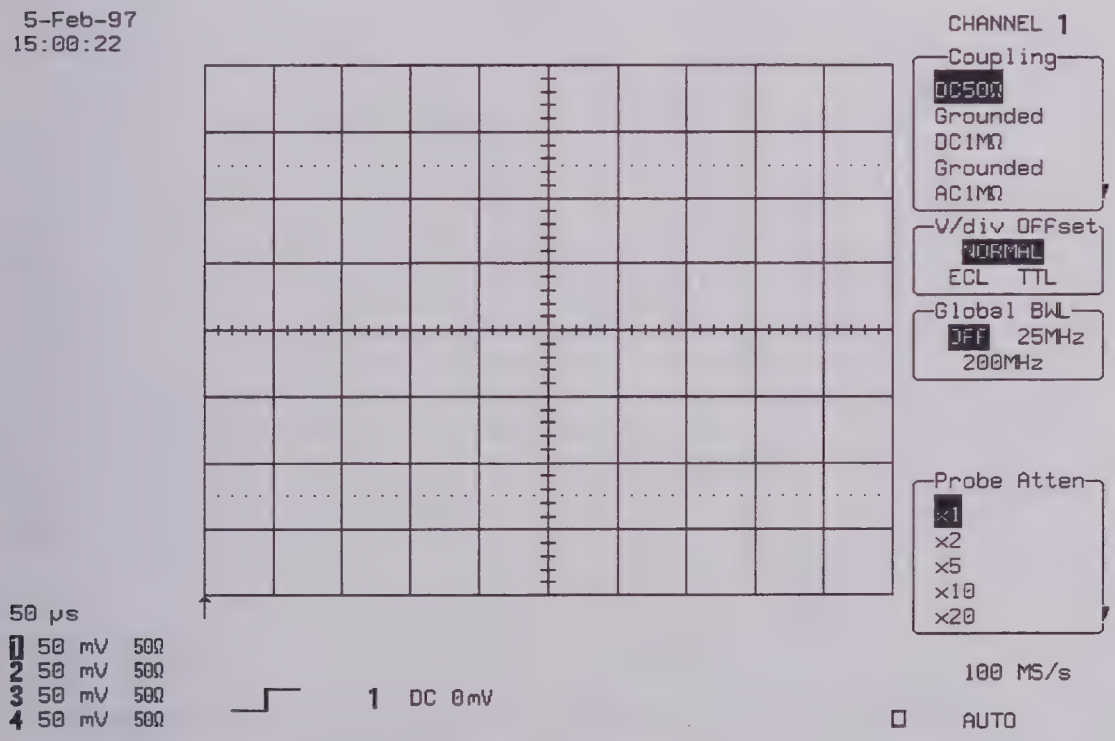
- For all input channels measure the **input impedance**.

- Record the input impedance in Table 2, and compare it to the limits.
- Recall **574p004.PNL** or Set Input gain to **200 mV/div** on all 4 Channels.
- Repeat the test for all input channels.
- Record the measurements in Table 2, and compare the results to the limits in the test record.

c. DC 50Ω

- Recall **574p005.PNL** or configure the DSO as shown in 5.4.1.a, and for each Channel make the following change:

  Input Coupling : **DC 50Ω**



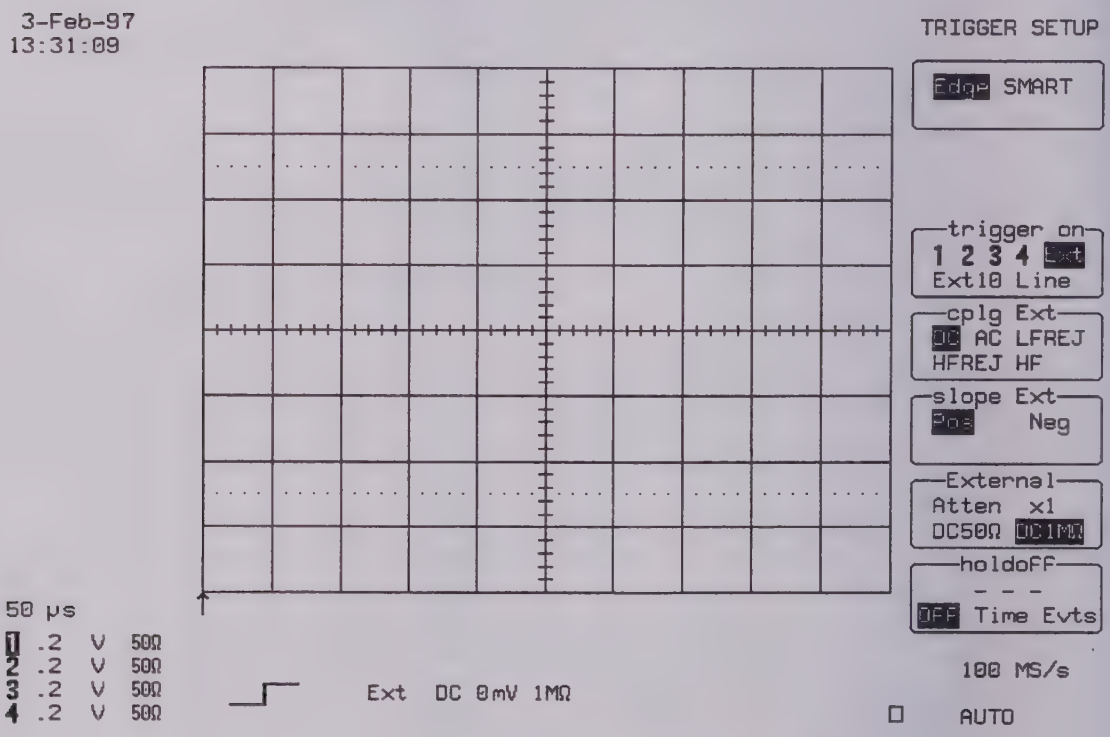
- For all input Channels, measure the input impedance.
- Record the **input impedance** in Table 2, and compare it to the limits.
- Recall **574p006.PNL** or set Input gain to **200 mV/div.** on all 4 Channels
- Repeat the test for all input channels. Record the measurements in Table 2, and compare the results to the limits in the test record.

5.4.2 External Trigger Input Impedance

a. DC 1MΩ

- Recall **574p007.PNL** or configure the DSO :

Set Trigger on	:	**EXT**
Trigger mode	:	**Auto**
Cplg Ext	:	**DC**
External	:	**DC 1MΩ**
Time base	:	**50 µsec/div.**



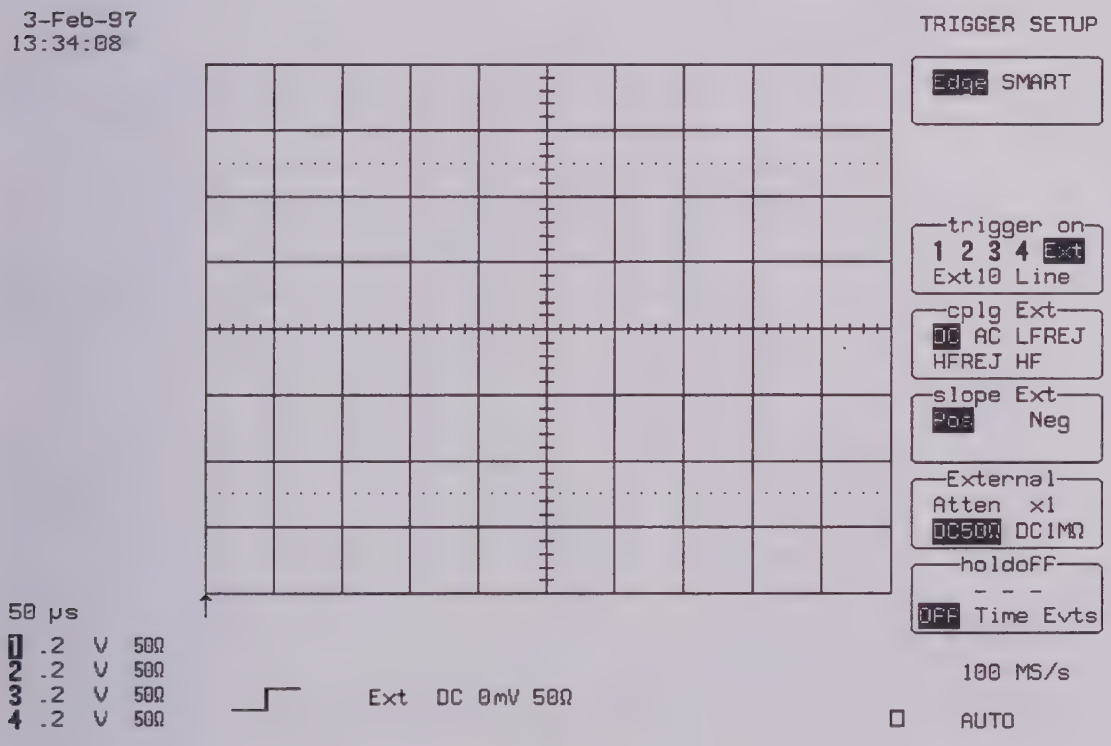
- Connect the DMM to External, and measure the **input impedance**.
- Record the input impedance in Table 2, and compare it to the limits.
- Recall **574p008.PNL** or set trigger to Ext/10
- Measure the **input impedance**.
- Record the test result in Table 2, and compare the result to the limits in the test record.

b. DC 50Ω

- Recall **574p009.PNL** or configure the DSO :

  Trigger on : **EXT**

  External : **DC 50Ω**

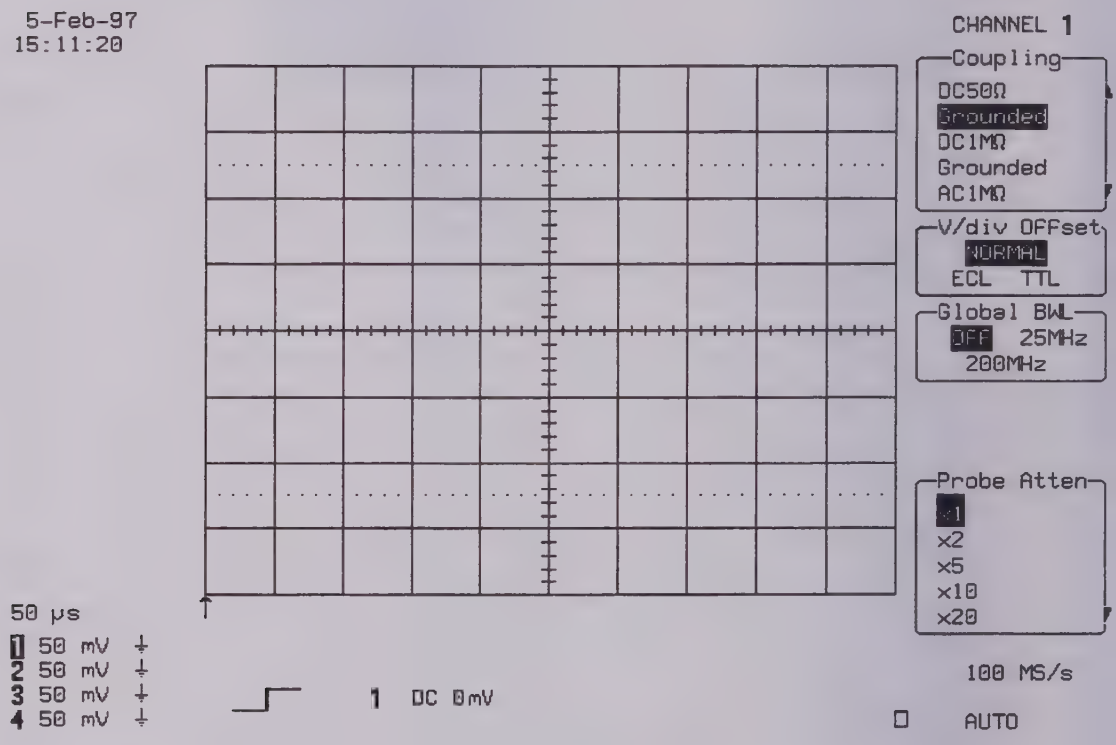


- Connect the DMM to External, and measure the **input impedance**.
- Record the input impedance in Table 2, and compare the result to the limit in the test record.

5.4.3 Ground

- Recall **574p010.PNL** or configure the DSO as shown in 5.4.1.a, and for each Channel make the following changes :

  Input Coupling : **Grounded**



- Connect the DMM to Channel 1, and measure the **input impedance.**
- Record the input impedance in Table 2, and compare the result to the limit in the test record.
- Repeat the test for all input channels.
- Record the measurements in Table 2, and compare the results to the limits in the test record.

5.5 Leakage Current

Specifications

DC 1MΩ, AC 1MΩ, DC 50Ω : ±1 mV

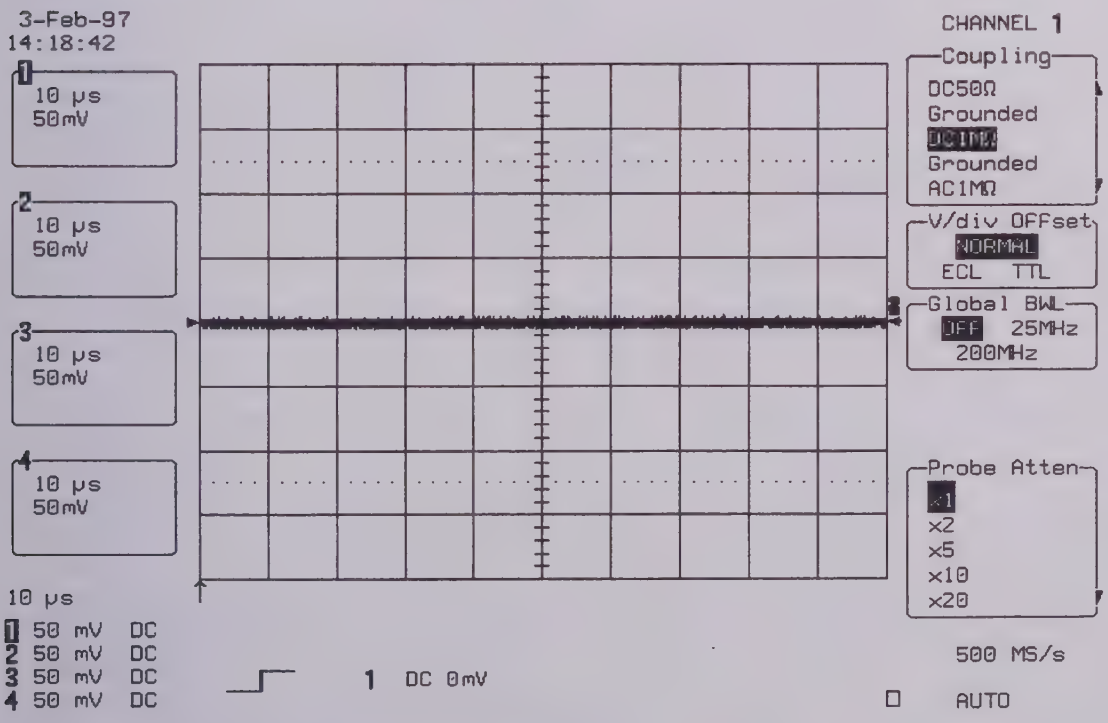
The leakage current is tested by measuring the voltage across the input channel.

5.5.1 Channel Leakage Current

a. DC 1MΩ

- Recall **574p011.PNL** or configure the DSO :

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channels Trace ON		**Channel 1, Channel 2, Channel 3 & Channel 4**
Input Coupling	:	**DC 1MΩ** on all 4 Channels
Input gain	:	**50 mV/div.** on all 4 Channels
Trigger mode	:	**Auto**
Time base	:	**10 µsec/div.**



- Set the DMM to measure Volts, and connect it to Channel 1.
- Measure the **voltage** and enter it in Table 3. Compare it to the limits.

- Repeat the test for all input channels.
- Recall **574p012.PNL** or set Input gain to **200 mV/div.** on all 4 Channels
- Repeat the test for all input channels. Record the measurements in Table 3, and compare the results to the limits in the test record.

b. DC 50Ω

- Recall **574p013.PNL** or configure the DSO as shown in 5.5.1.a and for each Channel make the following changes :

  Set Input Coupling: **DC 50Ω**

- Connect the DMM to Channel 1.
- Measure the **voltage** and enter it in Table 3. Compare it to the limits.
- Recall **574p014.PNL** or set Input gain to **200 mV/div.** on all 4 Channels
- Repeat the test for all input channels.
- Record the measurements in Table 3, and compare the results to the limits in the test record.

5.5.2 External Trigger Leakage Current

a. DC 50Ω

- Recall **574p015.PNL** or configure the DSO as shown in 5.5.1.a and make the following changes :

  Set Trigger on : **EXT**

  External : **DC 50Ω**

- Connect the DMM to External.
- Measure the **voltage** and enter it in Table 3. Compare it to the limits.

5.6 Average Noise Level

Description

Noise tests with open inputs are executed on all channels for both 1MΩ and 50Ω input impedance, with AC and DC input coupling, 0 mV offset, at a gain setting of 10 mV/div., and different timebase settings.
The scope parameters functions are used to measure the Peak and RMS amplitude of the noise.

5.6.1 Peak to Peak Noise

Specifications

9 % of full scale or 7.2 mV Peak Peak at 10 mV/div.

a. DC 1MΩ

With no signal connected to the inputs

- Recall **574p016.PNL** or configure the DSO :

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channels Trace ON		**Channel 1, Channel 2, Channel 3 & Channel 4**
Input Coupling	:	**DC 1MΩ** on all 4 Channels
Input gain	:	**10 mV/div.** on all 4 Channels
Input offset	:	**0.0 mV** on all 4 Channels
Trigger setup	:	**Edge**
Trigger on	:	**1**
Coupling 1	:	**DC**
Trigger Mode	:	**Auto**

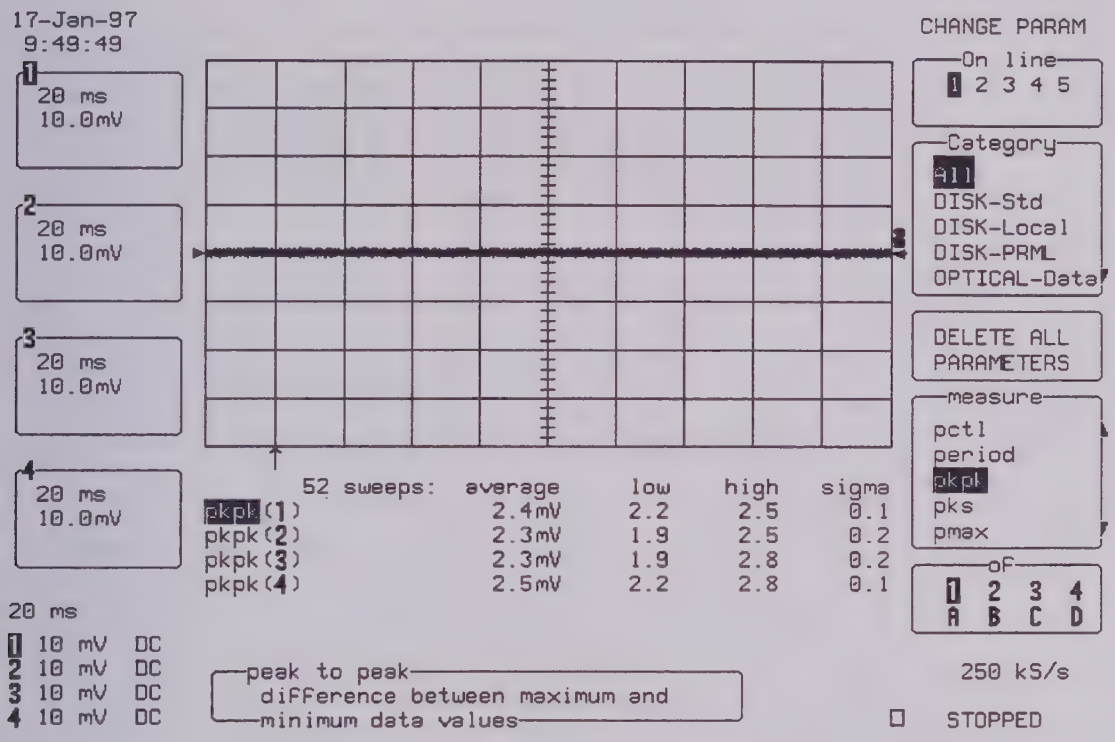
STOPPED



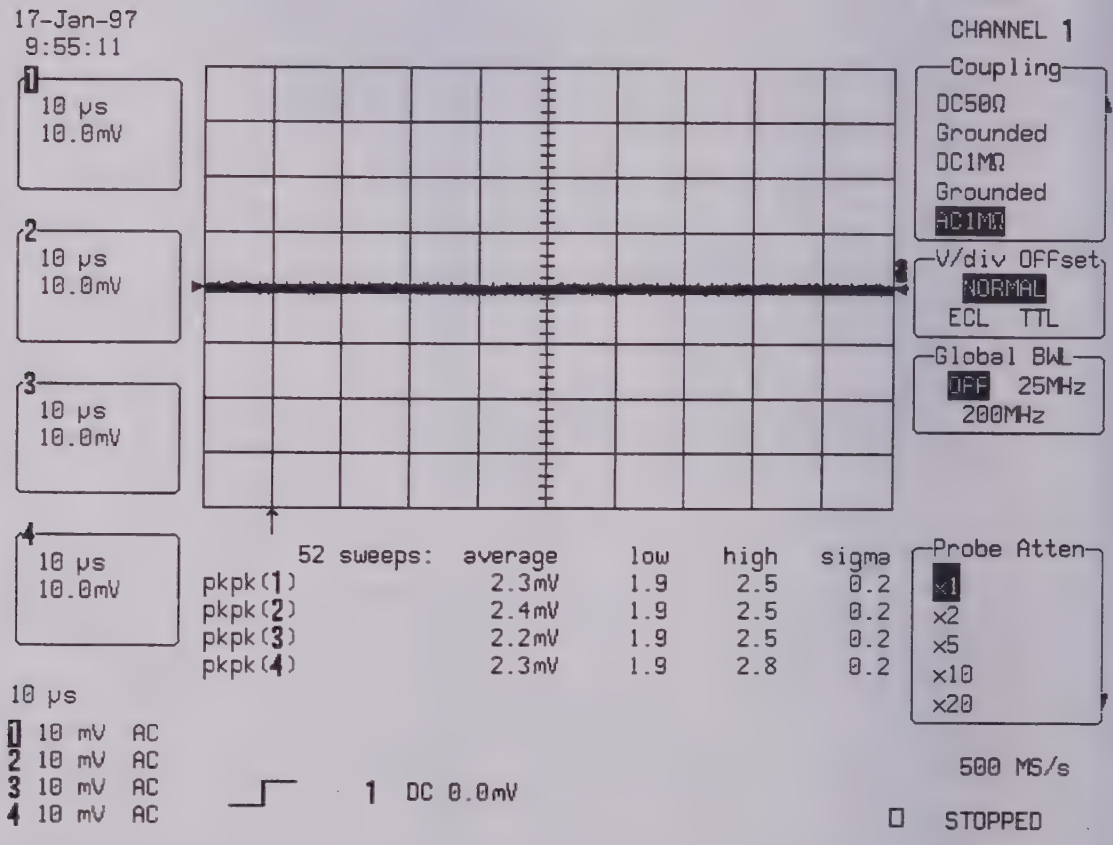
- Press **Clear Sweeps.**
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the four **high pkpk** parameter values in Table 4, and compare the test results to the limits in the test record.
- Repeat the test for Timebase : **1 msec/div.**, **50 μsec/div.**, and **10 μsec/div.**
- Record the measurements (high pkpk of 1,2,3,4) in Table 4, and compare the results to the limits in the test record.

b. AC 1MΩ

- Recall **574p017.PNL** or configure the DSO as shown in 5.6.1.a, and for each Channel make the following changes :

  Input Coupling : **AC 1MΩ**

- Press **Clear Sweeps.**
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the four **high pkpk** parameter values in Table 4, and compare the test results to the limits in the test record.



c. DC 50Ω

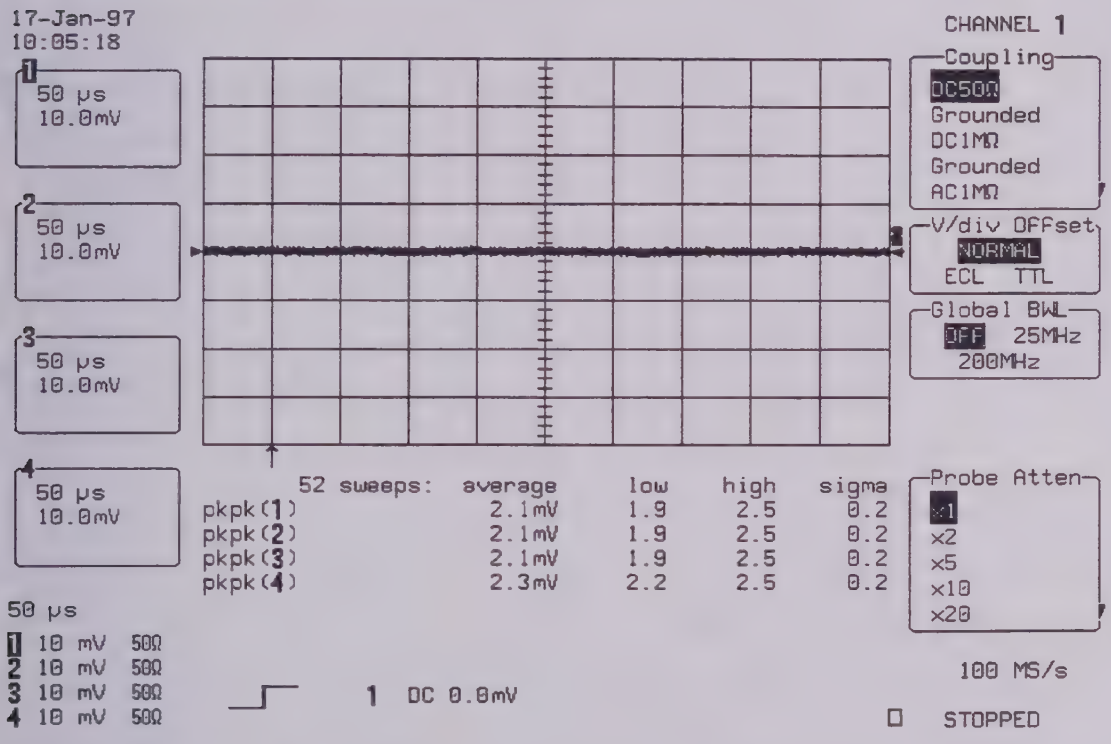
- Recall **574p018.PNL** or configure the DSO as shown in 5.6.1.a, and for each Channel make the following changes :

  Input Coupling : **DC 50Ω**

- Press **Clear Sweeps.**
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the four **high pkpk** parameter values in Table 4, and compare the test results to the limits in the test record.

- Repeat the test for Timebase : **50 µsec/div.**

- Record the measurements (high pkpk of 1,2,3,4) in Table 4, and compare the results to the limits in the test record.



d. DC 50Ω, 2 Channel Mode

- Recall **574p019.PNL** or configure the DSO as shown in 5.6.1.a. and make the following changes :

  Input Coupling : **DC 50Ω** on all 4 Channels

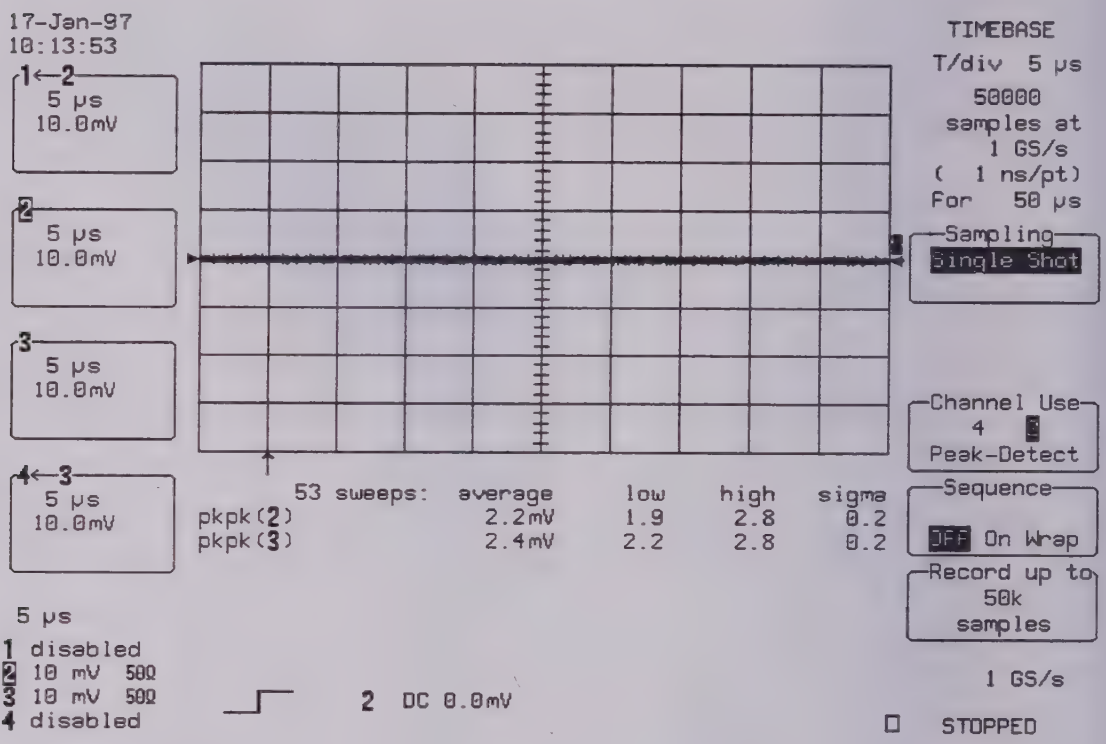
  Input gain : **10 mV/div.** on all 4 Channels

  Timebase : **5 µsec/div.**

  Select **Setup Timebase**

  Channel use : **2**
  Change parameters

  On line 1 : **Measure pkpk of Ch2**
  On line 2 : **Measure pkpk of Ch3**



- Press **Clear Sweeps.**
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the two **high pkpk** parameter values in Table 4, and compare the test results to the limits in the test record.

e. DC 50Ω, All Channels Combined

- Recall **574p020.PNL** or configure the DSO as shown in 5.6.1.a. and make the following changes :

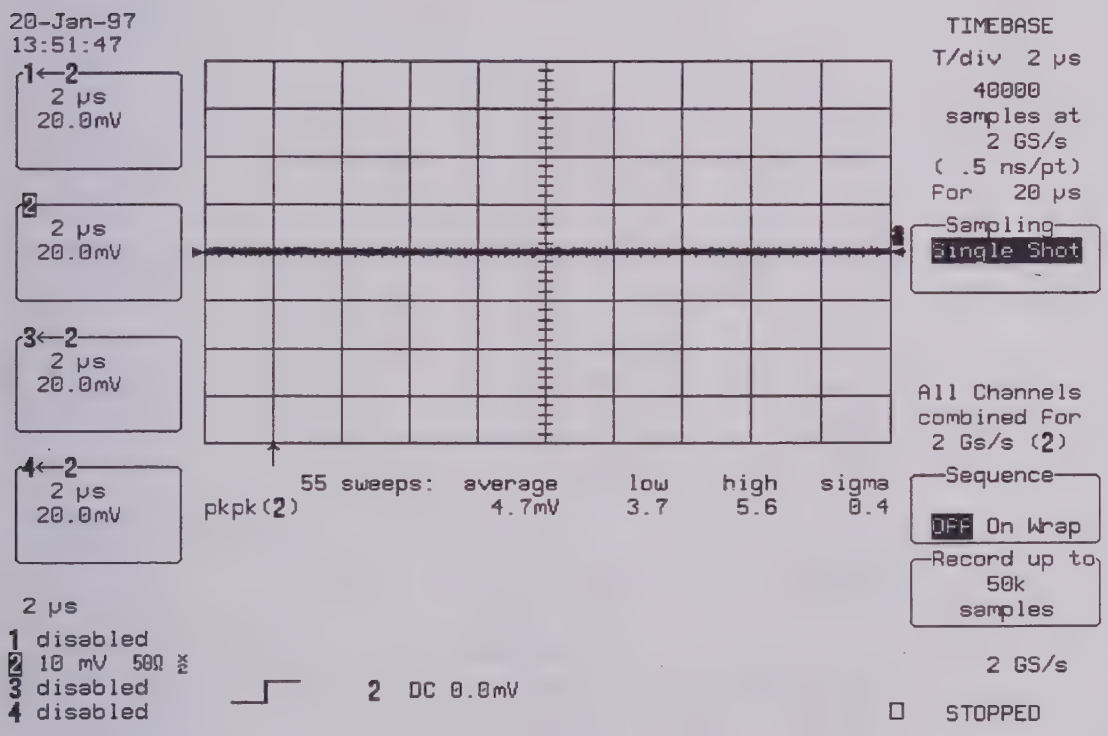
  Input Coupling : **DC 50Ω** on all 4 Channels

  Timebase : **2 µsec/div.**

  Change parameters
  On line 1 : **Measure pkpk of Ch2**

- Connect a **PP094** adapter to Channel 2 and Channel 3

- Check :
- PP094 is identified on **Channel 2.**
- Channel 1, Channel 3 and Channel 4 are **disabled**
- Sampling rate is **4 GS/s**



- Press **Clear Sweeps.**
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the **high pkpk** parameter value in Table 4, and compare the test result to the limits in the test record.
- Disconnect the **PP094** adapter.

5.6.2 Rms Noise

Specifications

0.9 % of full scale or 0.72 mV at 10 mV/div.

a. DC 1MΩ

Procedure

With no signal connected to the inputs

- Recall **574p021.PNL** or configure the DSO :

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channels Trace ON		**Channel 1, Channel 2, Channel 3 & Channel 4**
Input Coupling	:	**DC 1MΩ** on all 4 Channels
Input gain	:	**10 mV/div.** on all 4 Channels
Trigger setup	:	**Edge**
Trigger on	:	**1**
Coupling 1	:	**DC**
Trigger Mode	:	**Auto**
Timebase	:	**20 msec/div.**
Channel use	:	**4**
Record up to	:	**50 k Samples**
Press	:	**Cursors/Measure**
Measure	:	**Parameters**

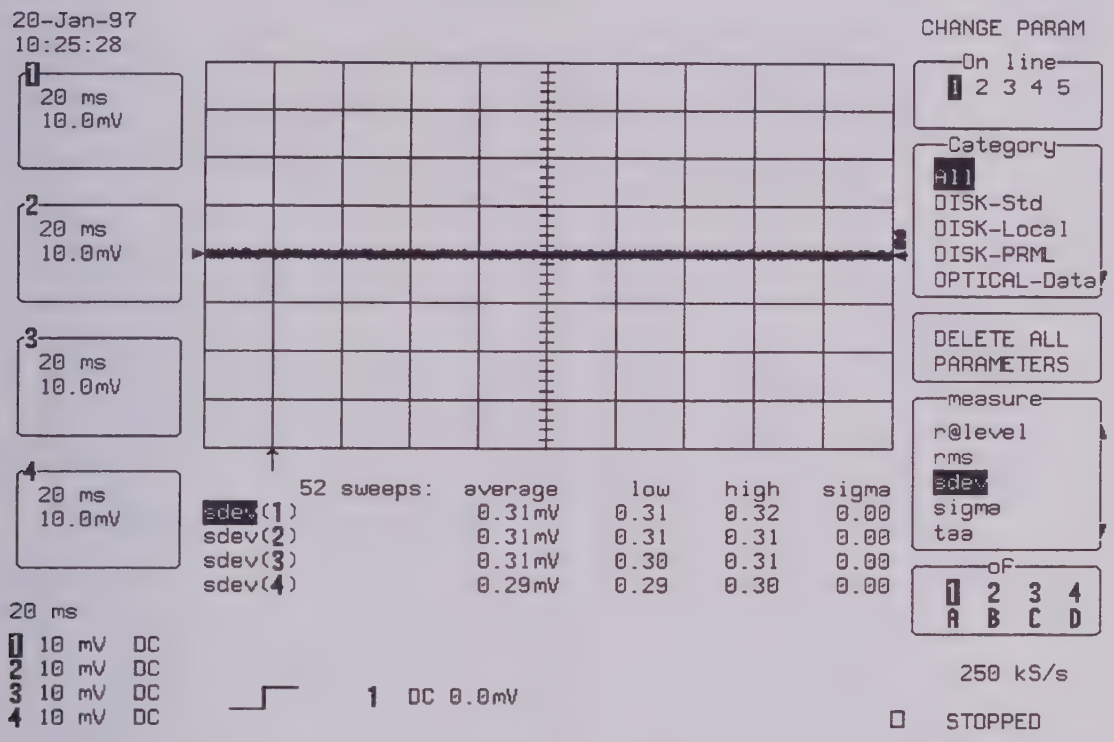
Statistics	:	**On**

Change parameters

Category	:	**All**
On line 1	:	**Measure sdev of Ch1**
On line 2	:	**Measure sdev of Ch2**
On line 3	:	**Measure sdev of Ch3**
On line 4	:	**Measure sdev of Ch4**
On line 5	:	**no parameter selected for line 5**



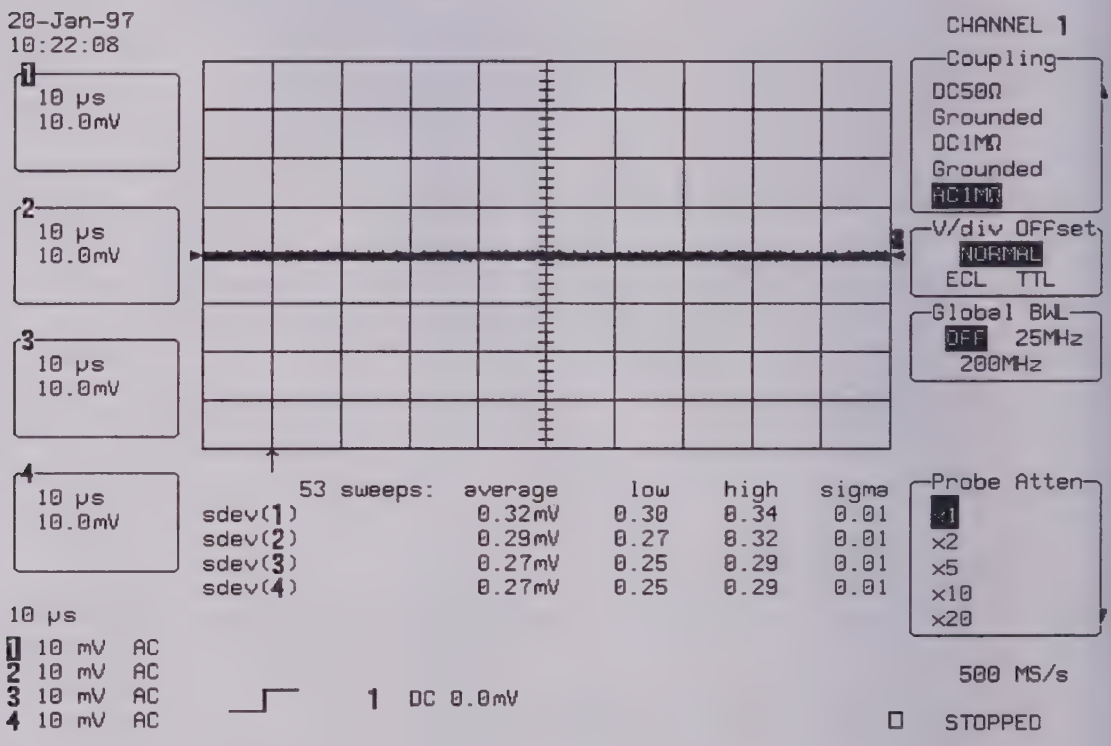
- Press **Clear Sweeps.**
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the four **high sdev** parameter values in Table 5, and compare the test results to the limits in the test record.
- Repeat the test for Timebase : **1 msec/div.**, **50 µsec/div.**, and **10 µsec/div.**
- Record the measurements (high sdev of 1,2,3,4) in Table 5, and compare the results to the limits in the test record.

b. AC 1MΩ

- Recall **574p022.PNL** or configure the DSO as shown in 5.6.2.a. and for each Channel make the following change :

  Input Coupling : **AC 1MΩ**

- Press **Clear Sweeps.**
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the four **high sdev** parameter values in Table 5, and compare the test results to the limits in the test record.



c. DC 50Ω

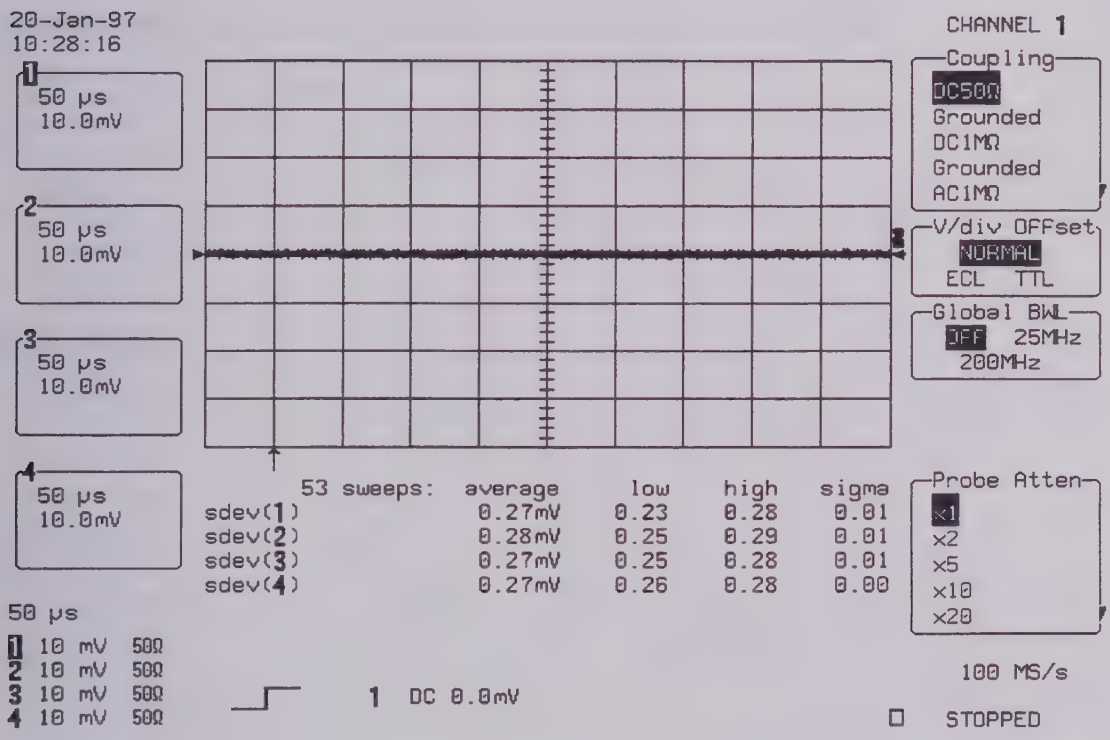
- Recall **574p023.PNL** or configure the DSO as shown in 5.6.2.a and make the following changes :

  Input Coupling : **DC 50Ω** on all 4 Channels

  Timebase : **10 µsec/div.**

- Press **Clear Sweeps.**
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the four **high sdev** parameter values in Table 5, and compare the test results to the limits in the test record.

- Repeat the test for Timebase : **50 µsec/div.**
- Record the measurements (high sdev of 1,2,3,4) in Table 5, and compare the results to the limits in the test record.



d. DC 50Ω, 2 Channel Mode

- Recall **574p024.PNL** or configure the DSO as shown in 5.6.2.a and make the following changes :

  Input Coupling : **DC 50Ω on all 4 Channels**

  Timebase : **5 µsec/div.**

  Select **Setup Timebase**

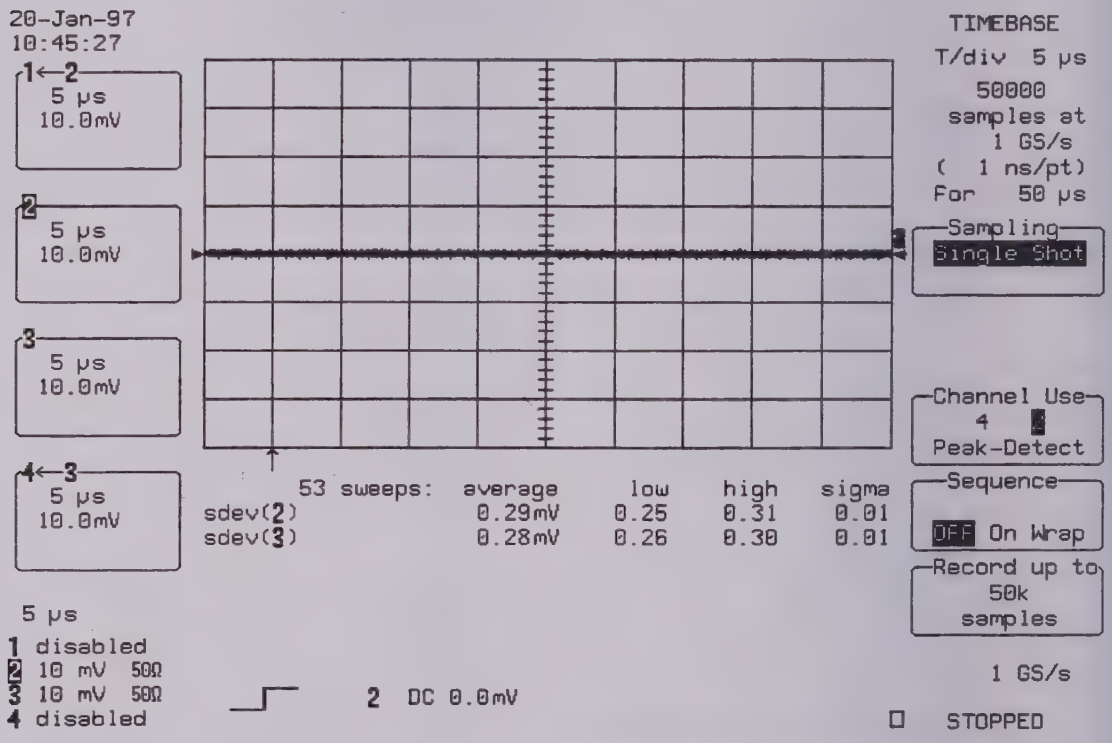
  Channel use : **2**

  Change parameters

  On line 1 : **Measure sdev of Ch2**

On line 2 : **Measure sdev of Ch3**

- Press **Clear Sweeps.**
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the two **high sdev** parameter values in Table 5, and compare the test results to the limits in the test record.



e. DC 50Ω, All Channels Combined

- Recall **574p025.PNL** or configure the DSO as shown in 5.6.2.a and make the following changes :

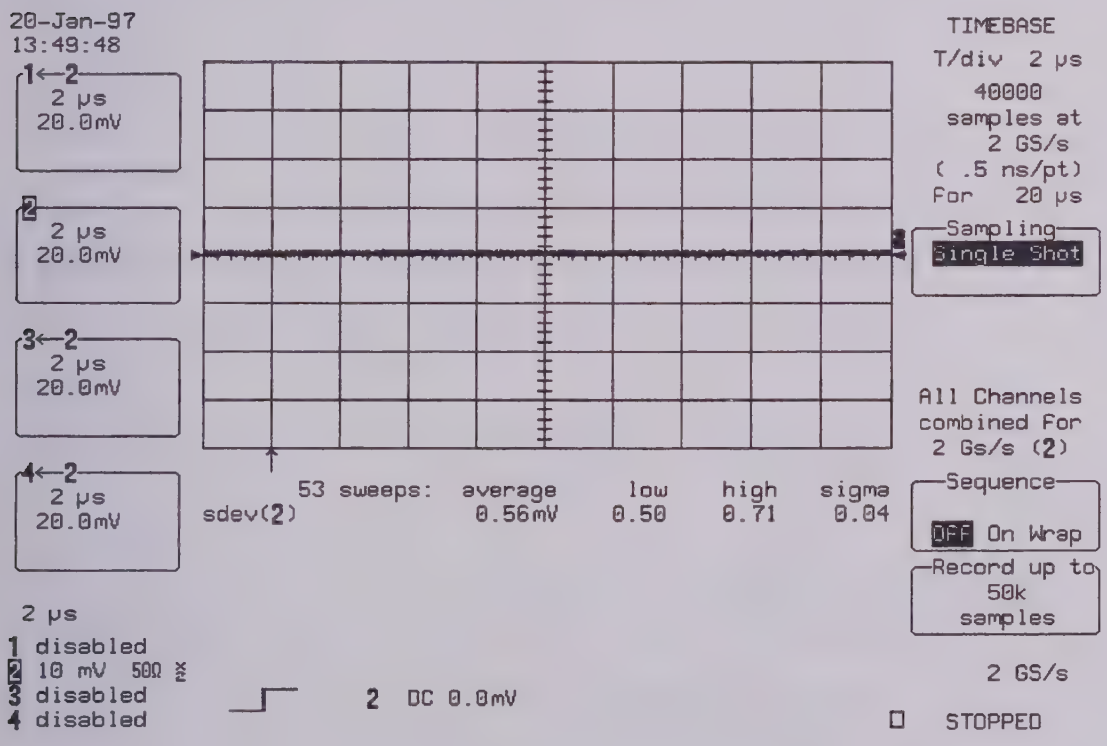
Input Coupling : **DC 50Ω** on all 4 Channels

Timebase : **2 µsec/div.**

Change parameters

On line 1 : **Measure sdev of Ch2**

- Connect a **PP094** adapter to Channel 2 and Channel 3
- Check :
- PP094 is identified on **Channel 2**
- Channel 1, Channel 3 and Channel 4 are **disabled**
- Sampling rate is **4 GS/s**



- Press **Clear Sweeps.**
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the **high sdev** parameter value in Table 5, and compare the test result to the limits in the test record.
- Disconnect the **PP094** adapter.

5.6.3 Ground Line Test

Specifications

±5 % of full scale at 5 mV/div.
±2 % of full scale at 10 mV/div. and above.

Procedure

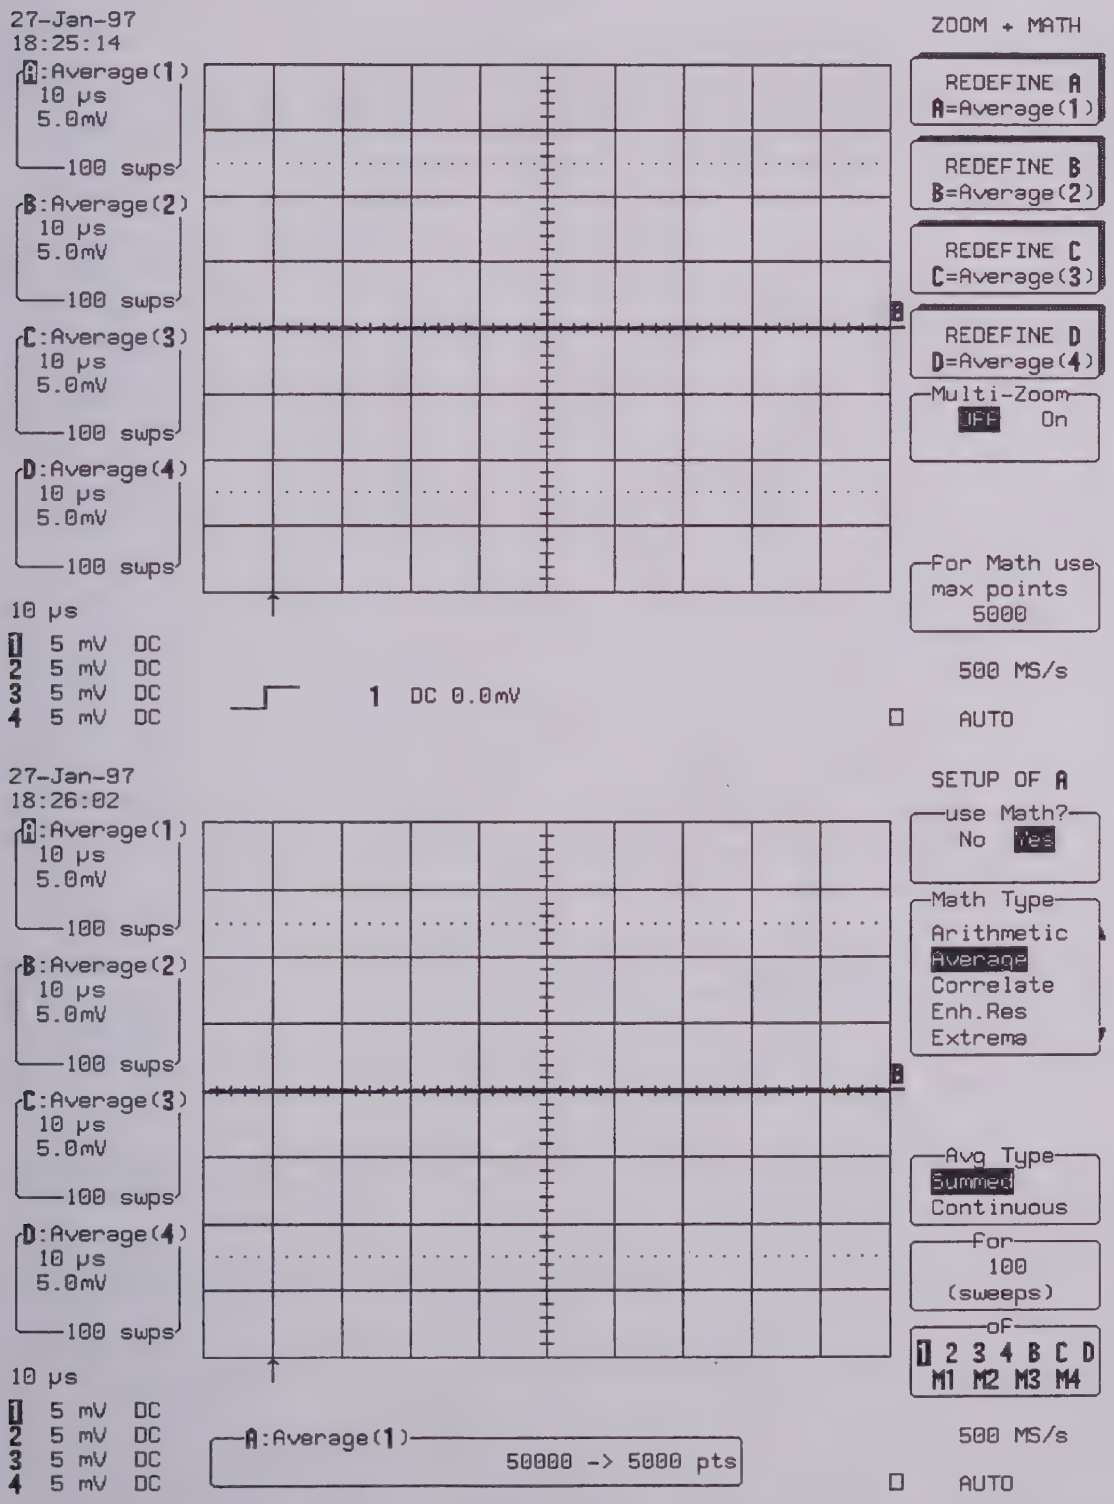
The stability of the ground line is verified for each channel at each fixed gain. The measured average values are checked against the desired limits.

a. DC 1MΩ

With no signal connected to the inputs

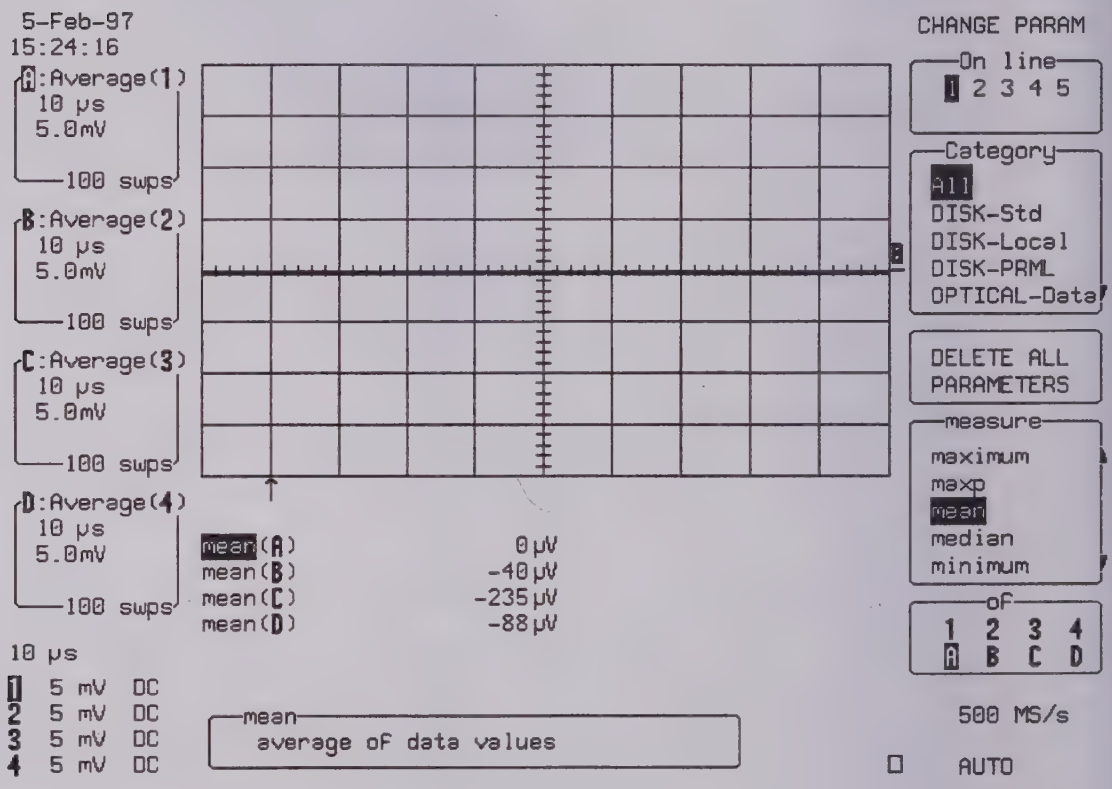
- Recall **574p026.PNL** or configure the DSO :

Channels Trace ON		**Channel 1, Channel 2, Channel 3 & Channel 4**
Input Coupling	:	**DC 1MΩ** on all 4 Channels
Input gain	:	**5 mV/div.** on all 4 Channels
Offset	:	**Zero** on all 4 Channels
Trigger on	:	**Channel 1, DC**
Trigger mode	:	**Auto**
Timebase	:	**10 µsec/div.**
Channel use	:	**4**
Record up	:	**50 k**
Channels Trace OFF		**Channel 1, Channel 2, Channel 3 & Channel 4**
Zoom+Math Trace ON		**A, B, C & D**
Select Math Setup		
For Math	:	**Use at most 5000 points**
Redefine A, B, C, D		**Channel 1, Channel 2, Channel 3 & Channel 4**
Use Math ?	:	**Yes**
Math Type	:	**Average**
Avg. Type	:	**Summed**
For	:	**100 sweeps**
Press Cursors/Measure		
Select	:	**Parameters**
Mode	:	**Custom**
Statistics	:	**off**



Change parameters

On line 1 : **Measure mean of A**
On line 2 : **Measure mean of B**
On line 3 : **Measure mean of C**
On line 4 : **Measure mean of D**

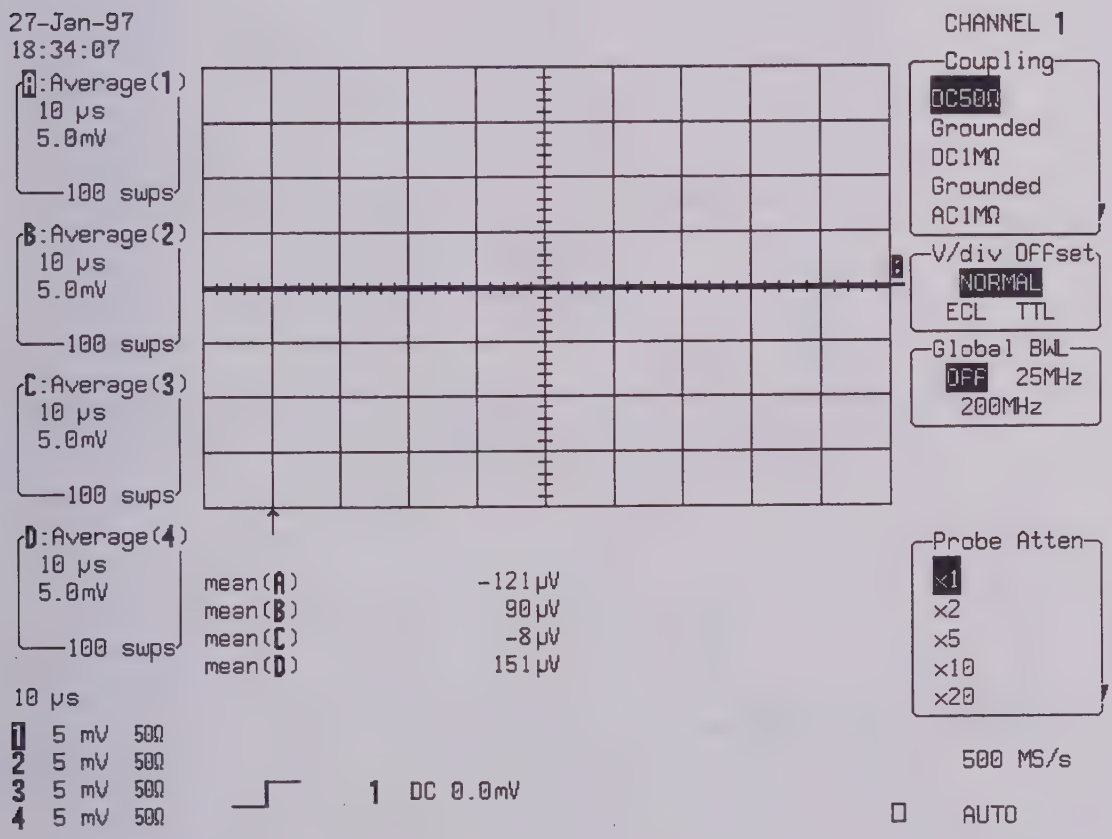


- Press **Clear Sweeps.**
- After **100 sweeps** record the **mean** value of **A, B, C & D** in Table 6, and compare the test results to the limits in the test record.
- Repeat step 5.6.3.a. for all vertical scale settings listed in Table 6, and check that the test results (mean value of A, B, C, D) are within the limits specified.
- Record the measurements in Table 6.

b. DC 50Ω

- Recall **574p027.PNL** or configure the DSO as shown in 5.6.3.a. and for each Channel make the following change :

  Input Coupling : **DC 50Ω**



- Press **Clear Sweeps.**
- After **100 sweeps** record the **mean** value of **A, B, C & D** in Table 7, and compare the test results to the limits in the test record.
- Repeat step 5.6.3.b. for all vertical scale settings listed in Table 7, and check that the test results (mean value of A, B, C, D) are within the limits specified.
- Record the measurements in Table 7.

c. DC 50Ω, 2 Channel Mode

- Recall **574p028.PNL** or configure the DSO as shown in 5.6.3.a. and make the following change :

  Input Coupling : **DC 50Ω** on all 4 Channels
  Input gain : **0.2 V/div.** on all 4 Channels
  Timebase : **5 µsec/div.**

  Select **Setup Timebase**

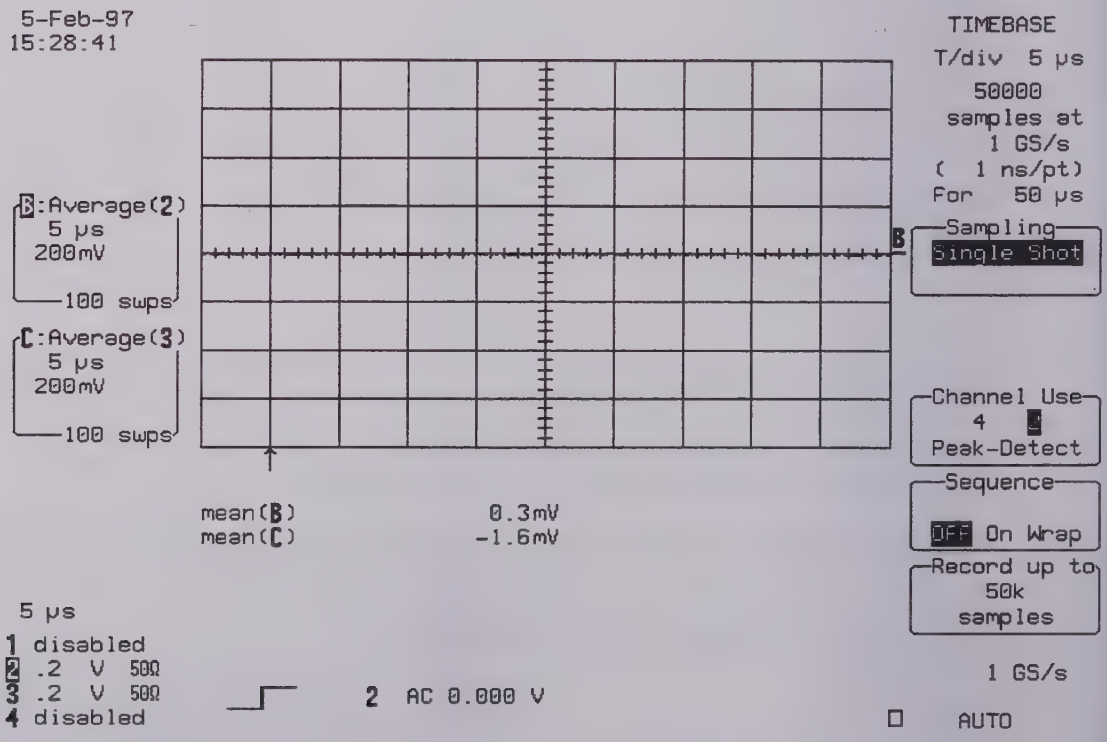
  Channel use : **2**

  Change parameters

  On line 1 : **Mean of B**
  On line 2 : **Mean of C**

- Press **Clear Sweeps.**

- After **100 sweeps** record the **mean** value of **B & C** in Table 7, and compare the test results to the limits in the test record.



d. DC 50Ω, All Channel Combined

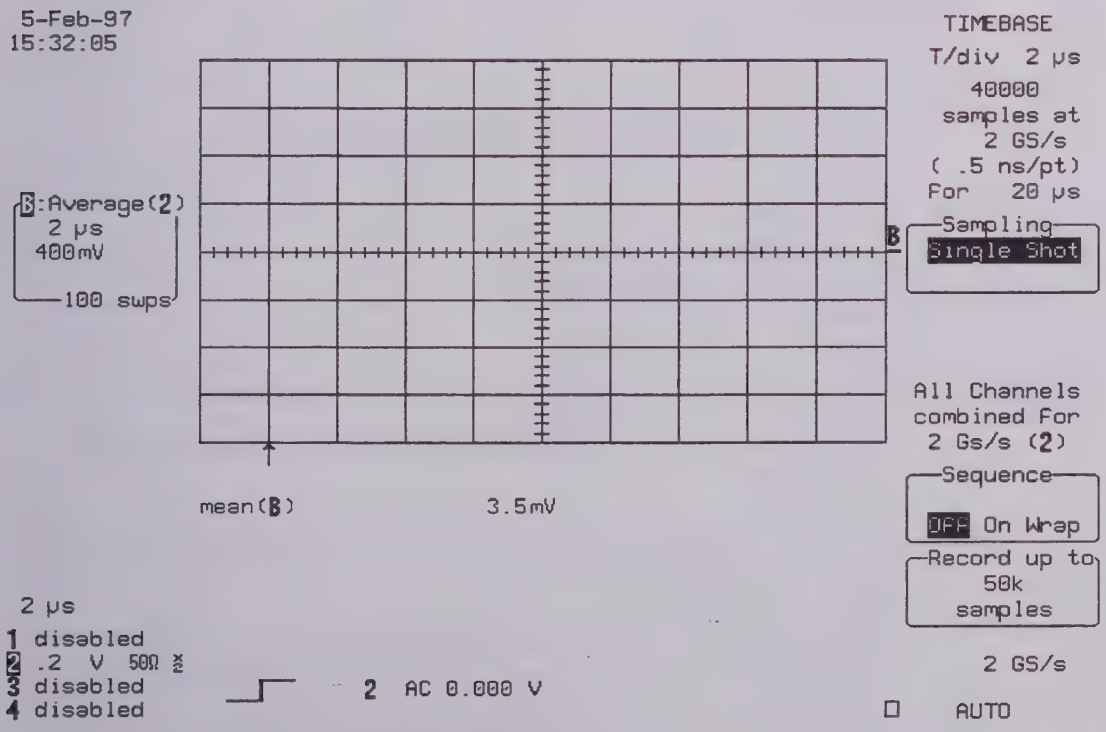
- Recall **574p029.PNL** or configure the DSO as shown in 5.6.3.a. and make the following changes :

Input Coupling	:	**DC 50Ω** on all 4 Channels
Input gain	:	**0.2 V/div.** on all 4 Channels
Timebase	:	**2 µsec/div.**
Change parameters		
On line 1	:	**Measure Mean of B**

- Connect a PP094 adapter to Channel 2 and Channel 3.
- Check :
- PP094 is identified on **Channel 2**
- Channel 1, Channel 3 and Channel 4 are **disabled**
- Sampling rate is **4 GS/s**

- Press **Clear Sweeps.**

- After **100 sweeps** record the **mean** value of **B** in Table 7, and compare the test result to the limits in the test record.



- Disconnect the **PP094** adapter.

5.7 DC Accuracy

Specification

≤ ±3 % of full scale at 5mV/div, with 0 mV offset.
≤ ±2 % of full scale at 10mV/div and above, with 0 mV offset.

Description

This test measures the DC Accuracy within the gain range specified.
It requires a DC source with a voltage range of 0 V to 20 V adjustable in steps of no more than 15 mV, and a calibrated DMM that can measure voltage to 0.1 %.
Measurements are made using voltage values applied by the external voltage reference source, measured by the DMM, and in the oscilloscope using the parameters Std voltage.
For each known input voltage, the deviation is checked against the tolerance.

5.7.1 Positive DC Accuracy

a. DC 50Ω

Procedure

- Recall **574p030.PNL** or configure the DSO :

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channels Trace ON		**Channel 1, Channel 2, Channel 3 & Channel 4**
Input Coupling	:	**DC 50Ω** on all 4 Channels
Input offset	:	**0.0 mV** on all 4 Channels
Input gain	:	from **5mV/div to 1 V/div.** (see Table 8) on all 4 Ch
Coupling 1	:	**DC**
Slope 1	:	**Pos.**
Mode	:	**Auto**
Holdoff	:	**Off**
Timebase	:	**2 msec/div**.
Channel use	:	**4**
Record up	:	**50 k**
Channels Trace OFF		**Channel 1, Channel 2, Channel 3 & Channel 4**
Zoom+Math Trace ON		**A, B, C & D**
Select Math Setup		
For Math	:	**Use at most 5000 points**
Redefine A, B, C, D		**Channel 1, Channel 2, Channel 3 & Channel 4**
Use Math ?	:	**Yes**
Math Type	:	**Average**
Avg. Type	:	**Summed**
For	:	**100 sweeps**

Cursors/Measure	:	**Parameters**
Mode	:	**Custom**
Statistics	:	**off**

Change parameters

On line 1	:	**Measure mean of A**
On line 2	:	**Measure mean of B**
On line 3	:	**Measure mean of C**
On line 4	:	**Measure mean of D**

- For the low sensitivities : **5 mV, 10 mV and 20 mV/div**., connect the test equipment as shown in Figure 5-1.

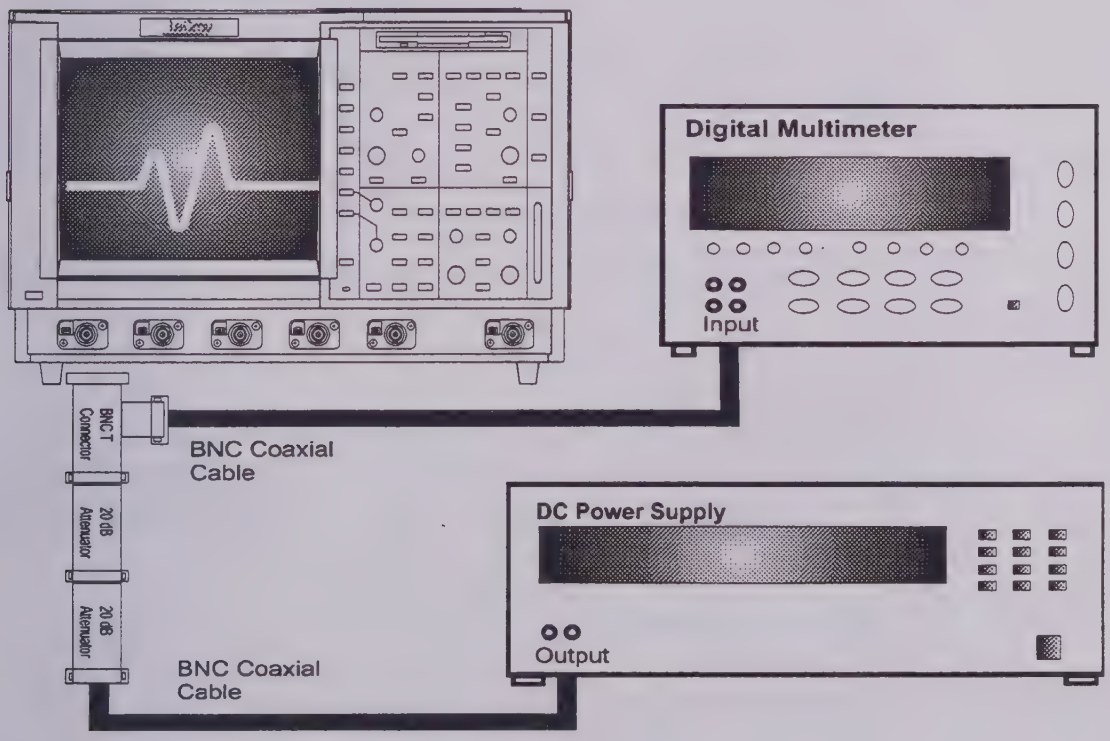


Figure 5-1 : DC 50Ω Accuracy Equipment Setup for 5, 10 and 20 mV/div

- For the sensitivities : 50 mV and 100 mV/div, connect the test equipment as shown in Figure 5-2.

- For the range 1 V/div no attenuator is required, connect the test equipment as shown in Figure 5-3.

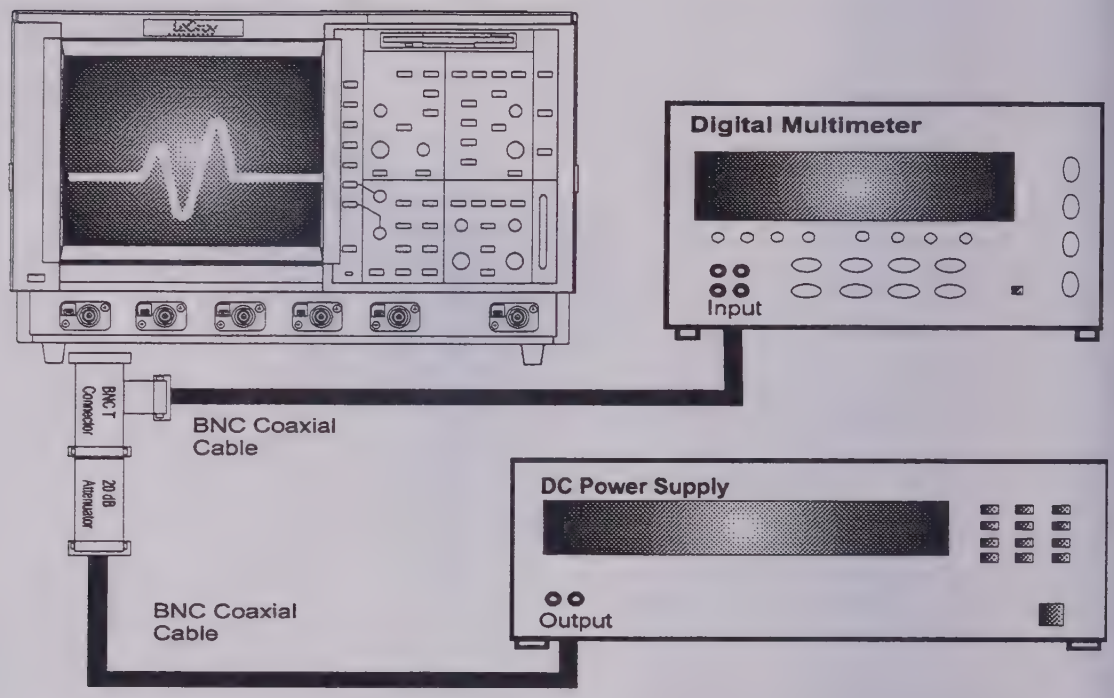

Figure 5-2 : DC 50Ω Accuracy Equipment Setup for 50 and 100 mV/div

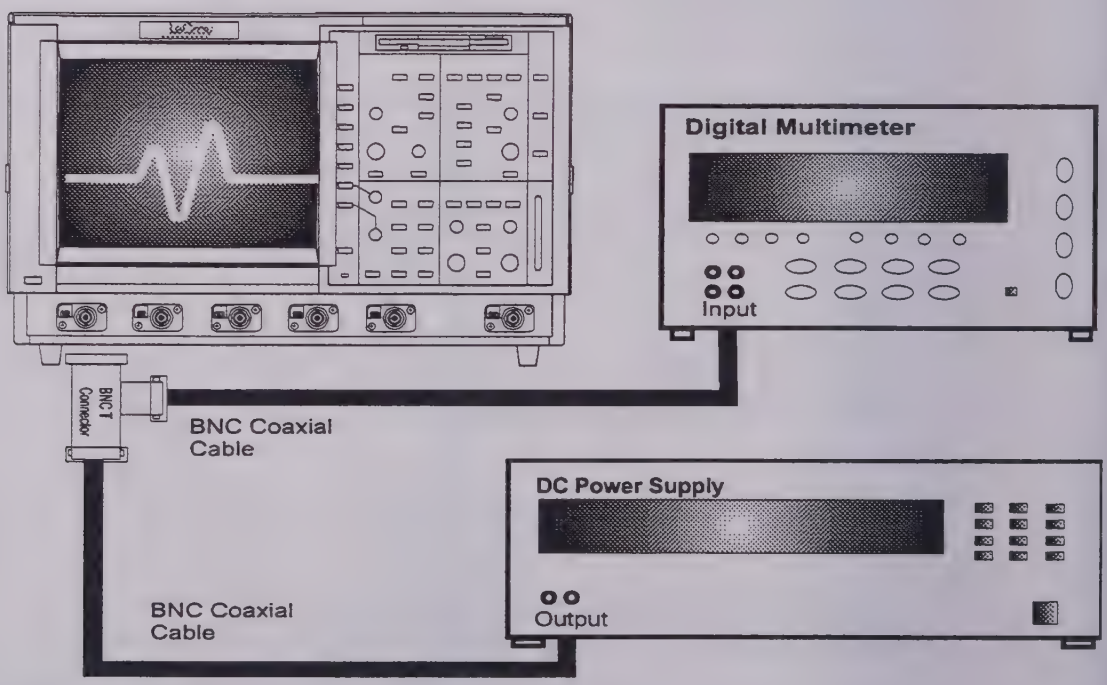

Figure 5-3 : DC 50Ω Accuracy Equipment Setup for 1 V/div.

- For each **DSO Volts/div**, set the output of the external **DC voltage reference source** as shown in Table 8, column PS output.

  1) Connect the DMM and record the **voltage reading** in Table 8, column **DMM.**

  2) Disconnect the DMM from the BNC T connector.

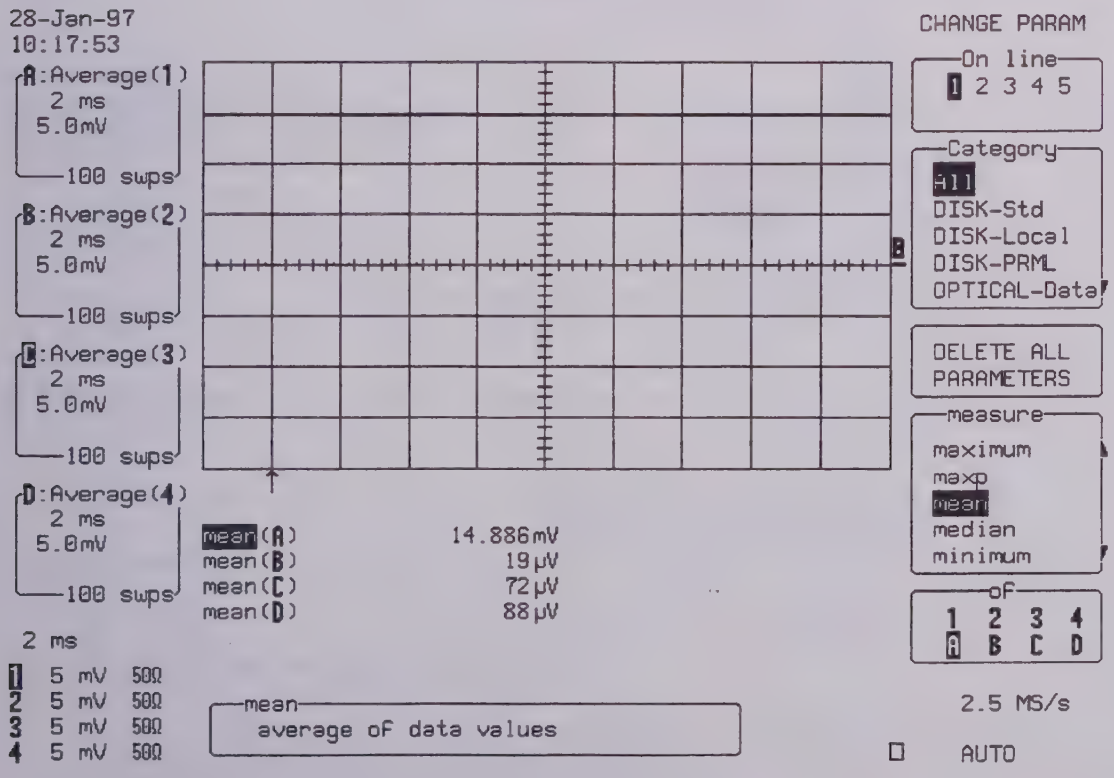
  3) Press **Clear Sweeps**

  4) After 100 sweeps, read off the **DSO mean parameter**, and record the measurement in Table 8, column **Mean**.

- For each DC voltage applied to the DSO input, repeat parts 1), 2), 3) and 4).

- Calculate the **Difference (Δ)** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 8, and compare the **Difference (Δ)** to the corresponding limit in the test record.

- Repeat step 5.7.1.a. for the other channels, substituting channel controls and input connector.



b. DC 1MΩ

Procedure

- Recall **574p031.PNL** or configure the DSO as shown in 5.7.1.a. and make the following change :

  Input Coupling : **DC 1MΩ** on all 4 Channels

- For 5 mV/div., connect the test equipment as shown in Figure 5-4.

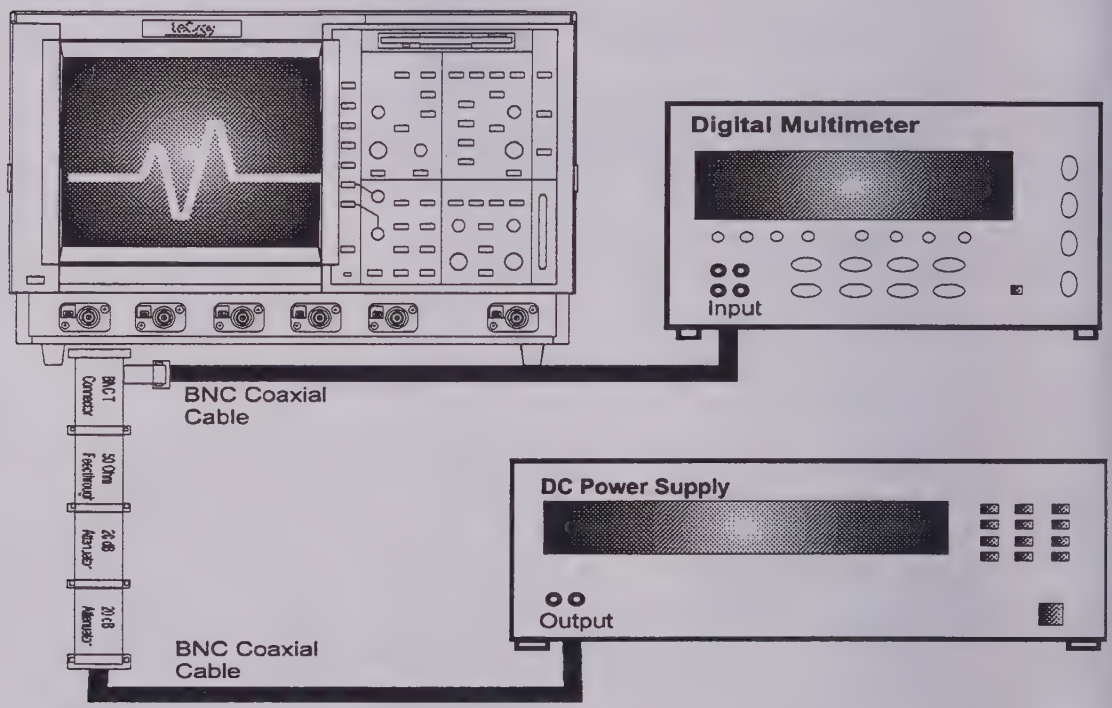


Figure 5-4: DC 1MΩ Accuracy Equipment Setup for 5 mV/div.

- For 100 mV/div, connect the test equipment as shown in Figure 5-5.
- For 5V/div no attenuator is required, connect the test equipment as shown in Figure 5-6.

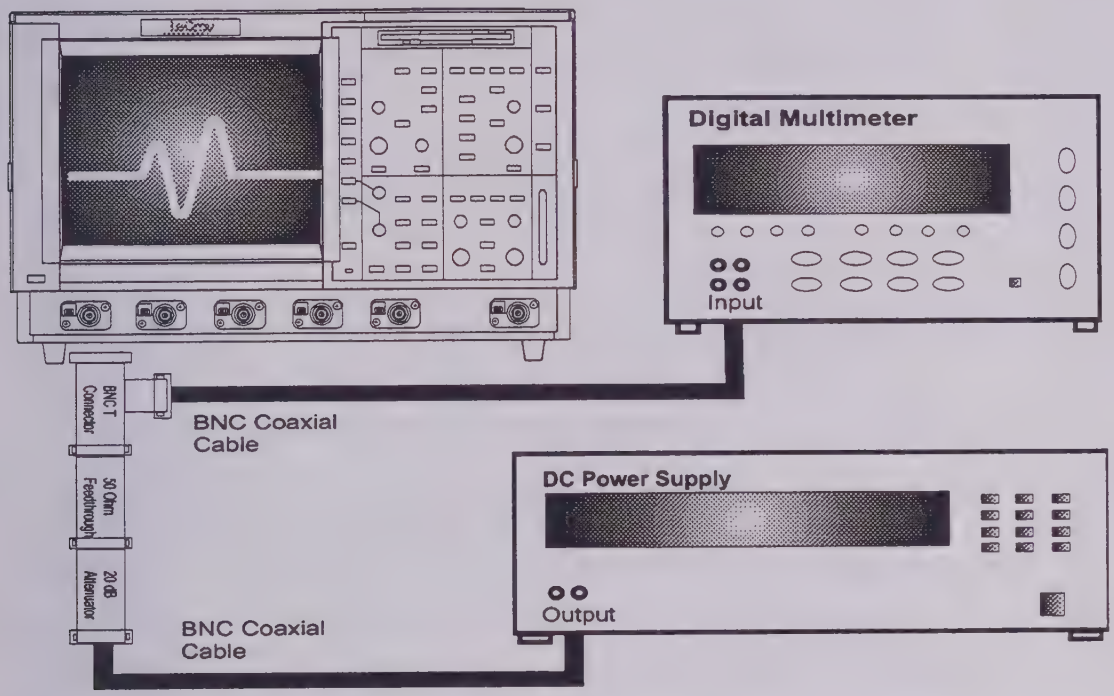

Figure 5-5 : DC 1MΩ Accuracy Equipment Setup for 100 mV/div

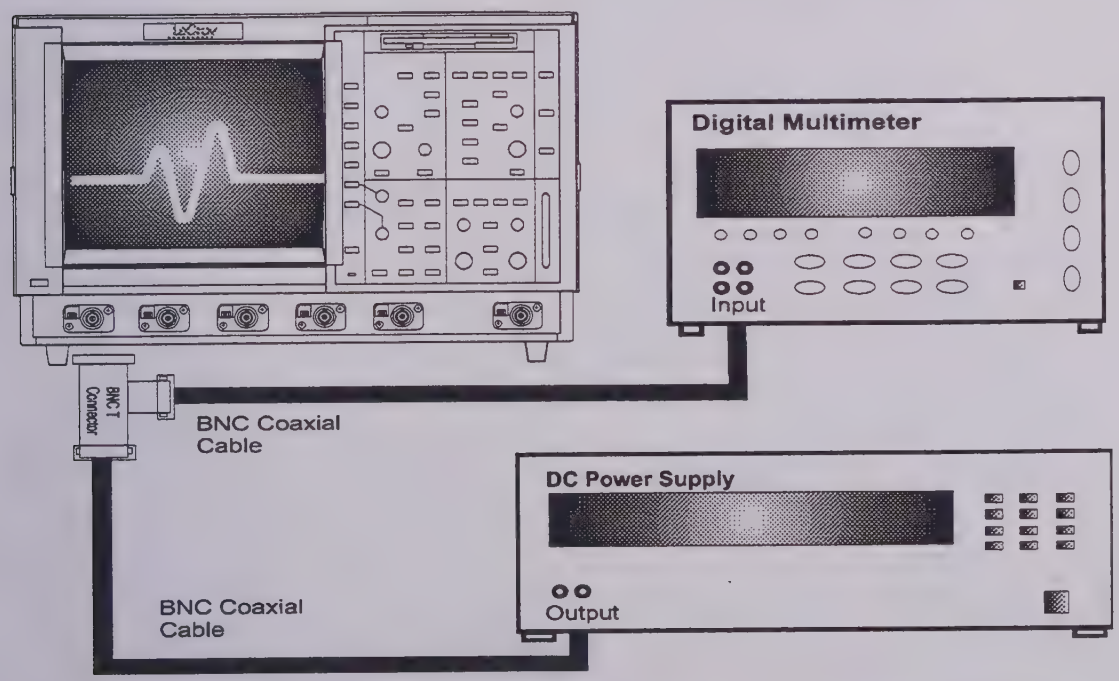

Figure 5-6 : DC 1MΩ Accuracy Equipment Setup for 5V/div.

- For each **DSO Volts/div**, set the output of the external **DC voltage reference source** as shown in Table 9, column PS output.

  1) Connect the DMM and record the **voltage reading** in Table 9, column **DMM.**

  2) Disconnect the DMM from the BNC T connector.

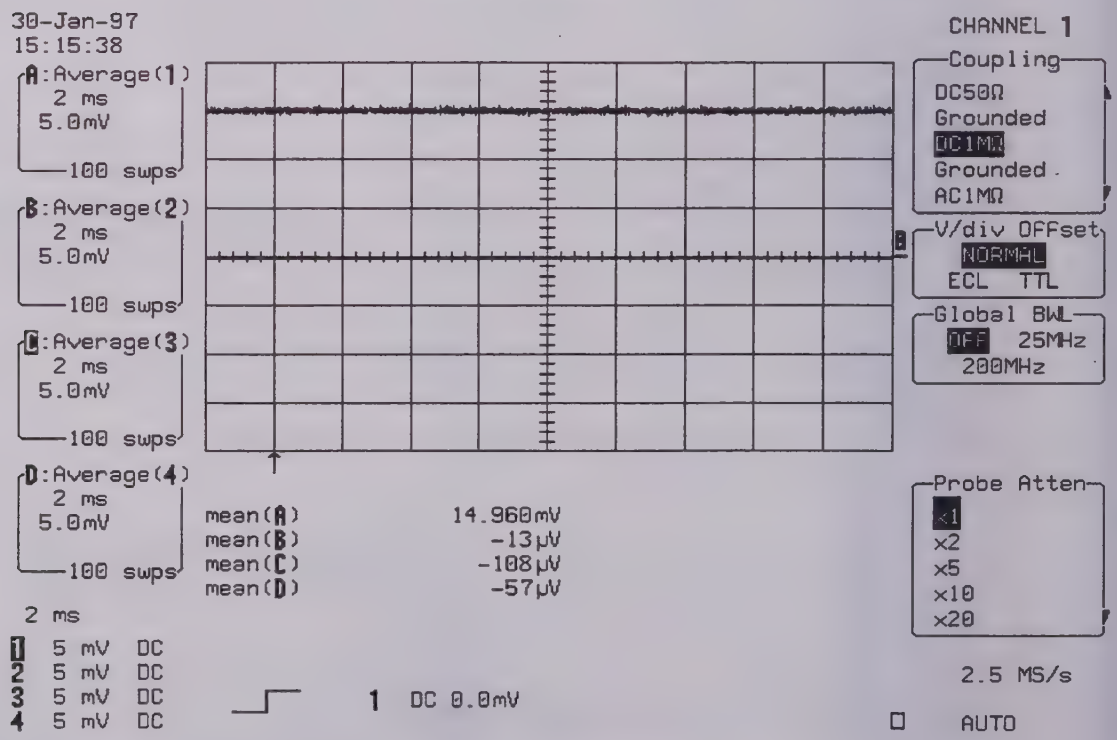
  3) Press **Clear Sweeps**

  4) After 100 sweeps, read off the **DSO mean parameter**, and record the measurement in Table 9, column **Mean**.

- For each DC voltage applied to the DSO input, repeat parts 1), 2), 3) and 4).

- Calculate the **Difference (Δ)** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 9, and compare the **Difference (Δ)** to the corresponding limit in the test record.

- Repeat step 5.7.1.b. for the other channels, substituting channel controls and input connector.



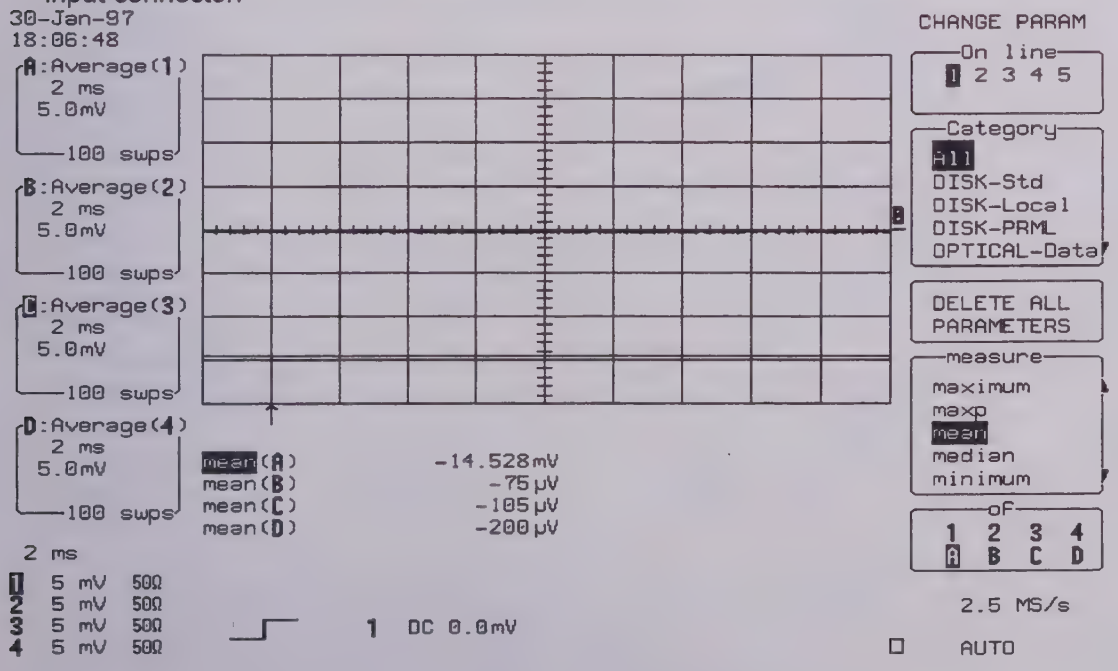
5.7.2 Negative DC Accuracy

a. DC 50Ω

- Recall **574p030.PNL** or configure the DSO as shown in 5.7.1.a.
- Connect the test equipment as shown in either Figure 5-1 or 5-2 or 5-3.
- For each **DSO Volts/div**, set the output of the external **DC voltage reference source** as shown in Table 10, column PS output. (if a banana-BNC adapter is being used it can simply be turned to get the opposite polarity)

  1) Connect the DMM and record the **voltage reading** in Table 10, column **DMM.**
  2) Disconnect the DMM from the BNC T connector.
  3) Press **Clear Sweeps**
  4) After 100 sweeps, read off the **DSO mean parameter**, and record the measurement in Table 10, column **Mean.**

- For each DC voltage applied to the DSO input, repeat parts 1), 2), 3) and 4).
- Calculate the **Difference (Δ)** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 10, and compare the **Difference (Δ)** to the corresponding limit in the test record.
- Repeat step 5.7.2.a. for the other channels, substituting channel controls and input connector.



b. DC 1 MΩ

- Recall **574p031.PNL** or configure the DSO as shown in 5.7.1.a. and make the following change :

  Input Coupling : **DC 1 MΩ** on all 4 Channels

- Connect the test equipment as shown in either Figure 5-4 or 5-5 or 5-6.

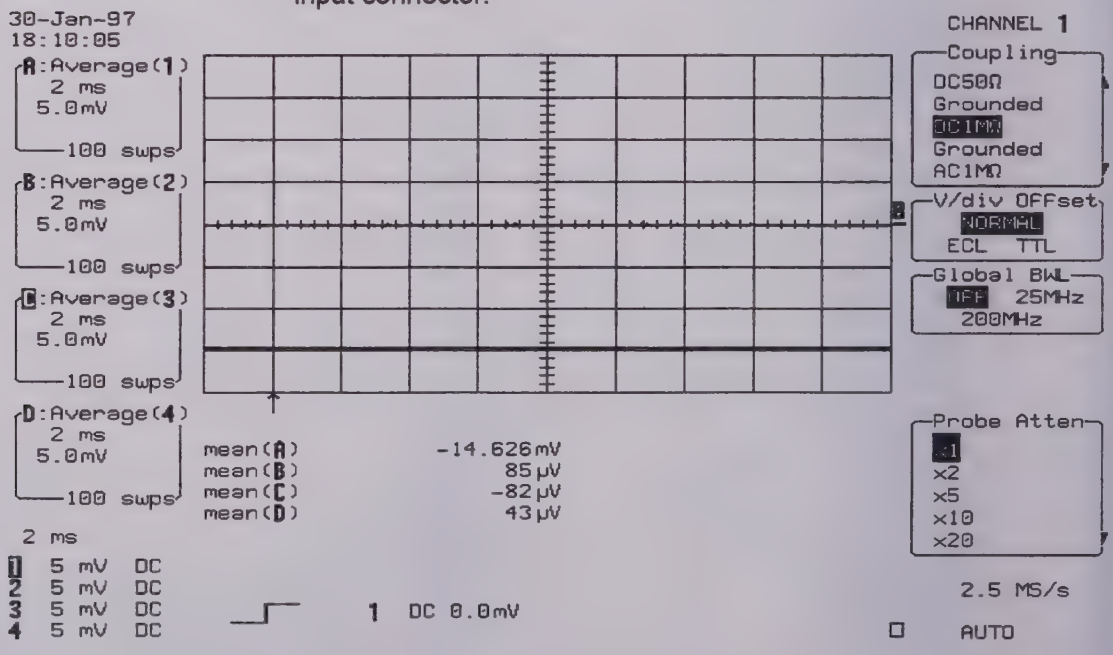
- For each **DSO Volts/div**, set the output of the external **DC voltage reference source** as shown in Table 11, column PS output.

  1) Connect the DMM and record the **voltage reading** in Table 11, column **DMM.**
  2) Disconnect the DMM from the BNC T connector.
  3) Press **Clear Sweeps**
  4) After 100 sweeps, read off the **DSO mean parameter**, and record the measurement in Table 11, column **Mean**.

- For each DC voltage applied to the DSO input, repeat parts 1), 2), 3) and 4).

- Calculate the **Difference (Δ)** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 11, and compare the **Difference (Δ)** to the corresponding limit in the test record.

- Repeat step 5.7.2.b. for the other channels, substituting channel controls and input connector.



5.8 Offset Accuracy

Specifications

Offset range ±1 Volt at 5 mV/div
Accuracy ≤ ±11.2 mV (3 % of full scale +1 % of offset).

Description

The offset test is done at 5 mV/div, for 50Ω and 1MΩ couplings, with a signal of ±1 Volt cancelled by an offset of the other polarity.

5.8.1 Positive Offset Accuracy

a. DC 50Ω

Procedure

- Recall **574p032.PNL** or configure the DSO :

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channels Trace ON		**Channel 1, Channel 2, Channel 3 & Channel 4**
Input Coupling	:	**DC 50Ω** on all 4 Channels
Input gain	:	**5mV/div** on all 4 Channels
Input offset	:	**+1 Volt** on all 4 Channels
Trigger setup	:	**Edge**
Trigger on	:	**1**
Coupling 1	:	**DC**
Slope 1	:	**Pos.**
Mode	:	**Auto**
Timebase	:	**2 msec/div**.
Channel use	:	**4**
Record up	:	**50 k**
Channels Trace OFF		**Channel 1, Channel 2, Channel 3 & Channel 4**
Zoom+Math Trace ON		**A, B, C & D**
Select Math Setup		
For Math	:	**Use at most 5000 points**
Redefine A, B, C, D		**Channel 1, Channel 2, Channel 3 & Channel 4**
Use Math ?	:	**Yes**
Math Type	:	**Average**
Avg. Type	:	**Summed**
For	:	**100 sweeps**
Cursors/Measure	:	**Parameters**
Mode	:	**Custom**

Statistics	:	**off**
Change parameters		
On line 1	:	**Measure mean of A**
On line 2	:	**Measure mean of B**
On line 3	:	**Measure mean of C**
On line 4	:	**Measure mean of D**

- Connect the test equipment as shown in Figure 5-7.

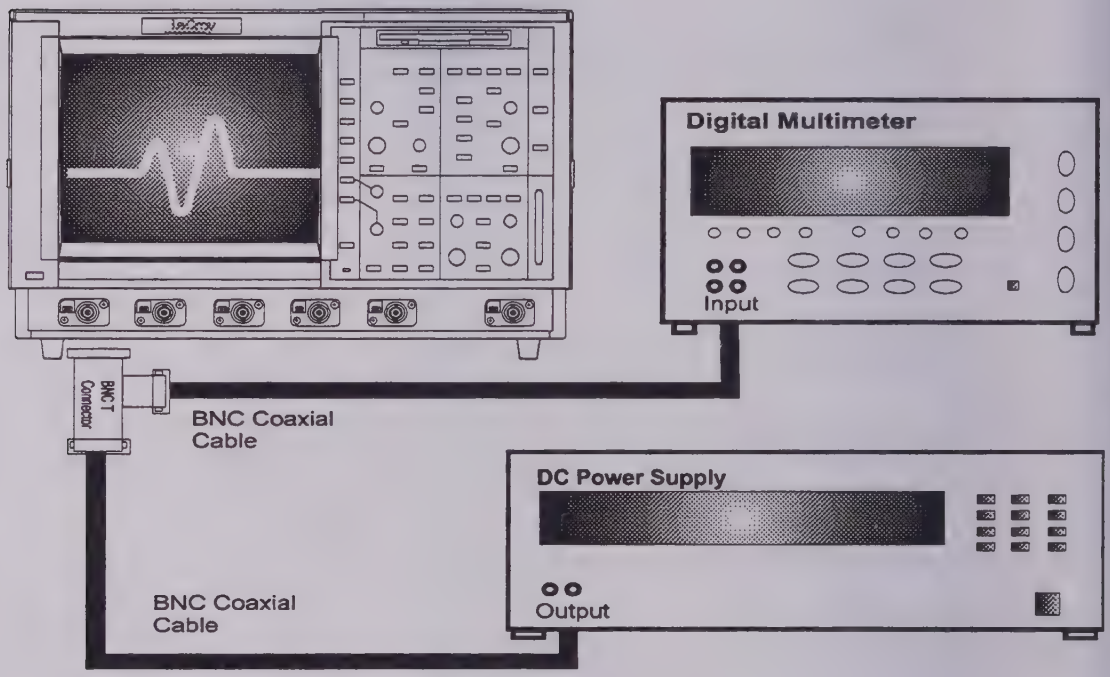


Figure 5-7 : Offset Accuracy Equipment Setup

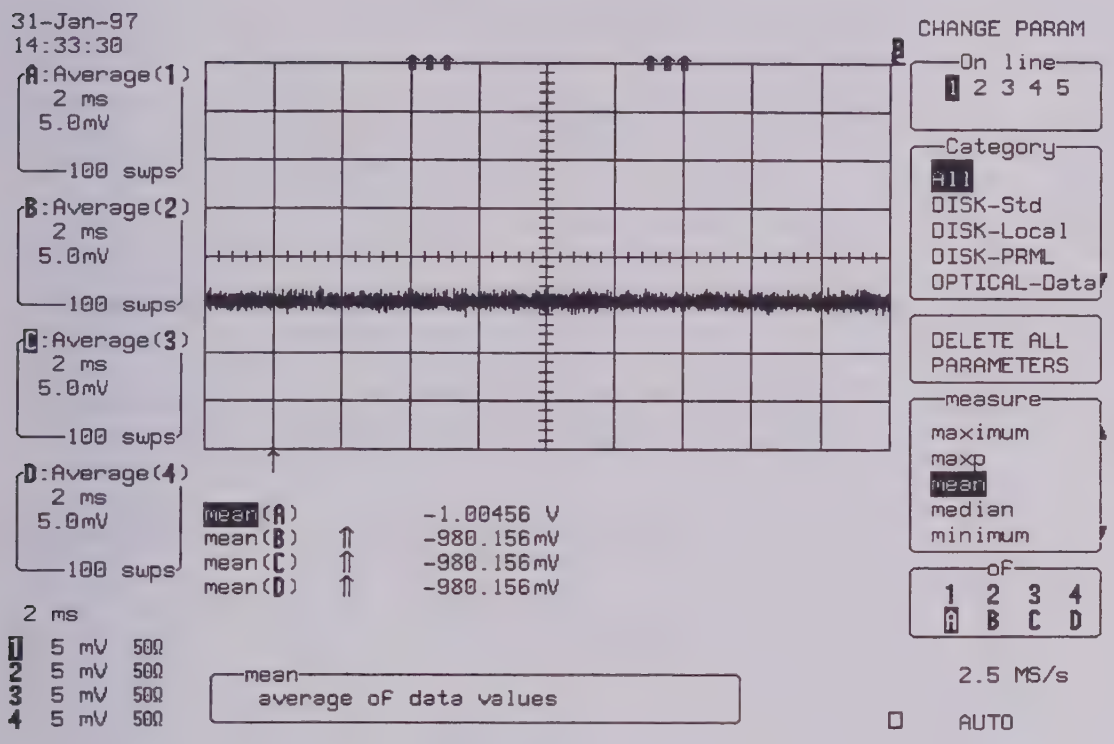
- Set the output of the external **DC voltage reference source** to **–1 Volt**.
- Verify that the displayed trace A : Average (1) is in the screen, near to the center horizontal graticule line.
- Connect the DMM and record the **voltage reading** in Table 12, column **DMM**.
- Disconnect the DMM from the BNC T connector.
- Press **Clear Sweeps**
- After 100 sweeps, Read off the **DSO Mean parameter** voltage, and record the measurement in Table 12, column **Mean**.



- Calculate the **Difference (Δ)** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 12, and compare the **Difference (Δ)** to the corresponding limit in the test record.

- Repeat the test for the other channels, substituting channel controls and input connector. Record the measurements in Table 12.

b. DC 1MΩ

Procedure

- Recall **574p033.PNL** or configure the DSO as shown in 5.8.1.a. and for each Channel make the following change :

  Input Coupling : **DC 1MΩ**

- Connect the test equipment as shown in Figure 5-7.

- Set the output of the external **DC voltage reference source** to **–1 Volt**.

- Verify that the displayed trace A : Average (1) is in the screen, near to the center horizontal graticule line.
- Connect the DMM and record the **voltage reading** in Table 12, column **DMM**.
- Disconnect the DMM from the BNC T connector.
- Press **Clear Sweeps**
- After 100 sweeps, Read off the **DSO Mean parameter** voltage, and record the measurement in Table 12, column **Mean**.
- Calculate the **Difference (Δ)** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 12, and compare the **Difference (Δ)** to the corresponding limit in the test record.
- Repeat the test for the other channels, substituting channel controls and input connector. Record the measurements in Table 12.

5.8.2 Negative Offset Accuracy

a. DC 50Ω

Procedure

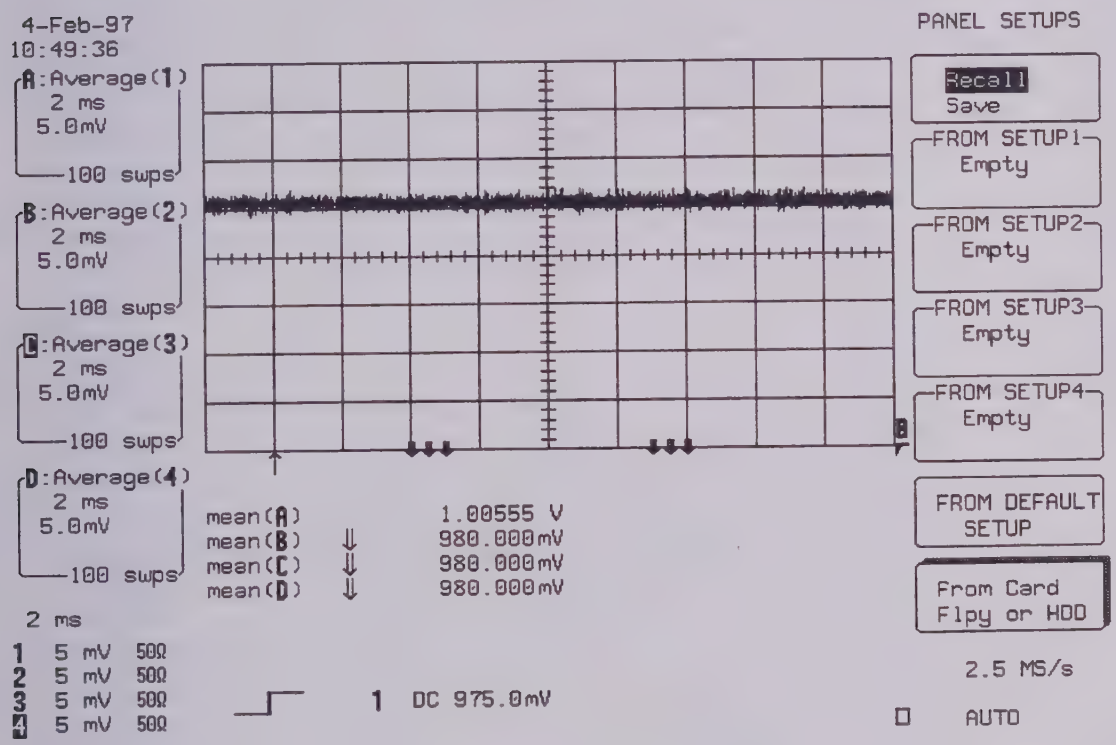
- Recall **574p034.PNL** or configure the DSO as shown in 5.8.1.a. and for each Channel make the following change :

  Input offset : **–1 Volt**

- Connect the test equipment as shown in Figure 5-7.
- Set the output of the external **DC voltage reference source** to **+1 Volt**.
- Verify that the displayed trace A : Average (1) is in the screen, near to the center horizontal graticule line.
- Connect the DMM and record the **voltage reading** in Table 13, column **DMM**.
- Disconnect the DMM from the BNC T connector.
- Press **Clear Sweeps**
- After 100 sweeps, Read off the **DSO Mean parameter** voltage, and record the measurement in Table 13, column **Mean**.

- Calculate the **Difference (Δ)** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 13, and compare the **Difference (Δ)** to the corresponding limit in the test record.

- Repeat the test for the other channels, substituting channel controls and input connector. Record the measurements in Table 13.



b. DC 1MΩ

- Recall **574p035.PNL** or configure the DSO as shown in 5.8.1.a. and for each Channel make the following changes :

  Input Coupling : **DC 1MΩ**

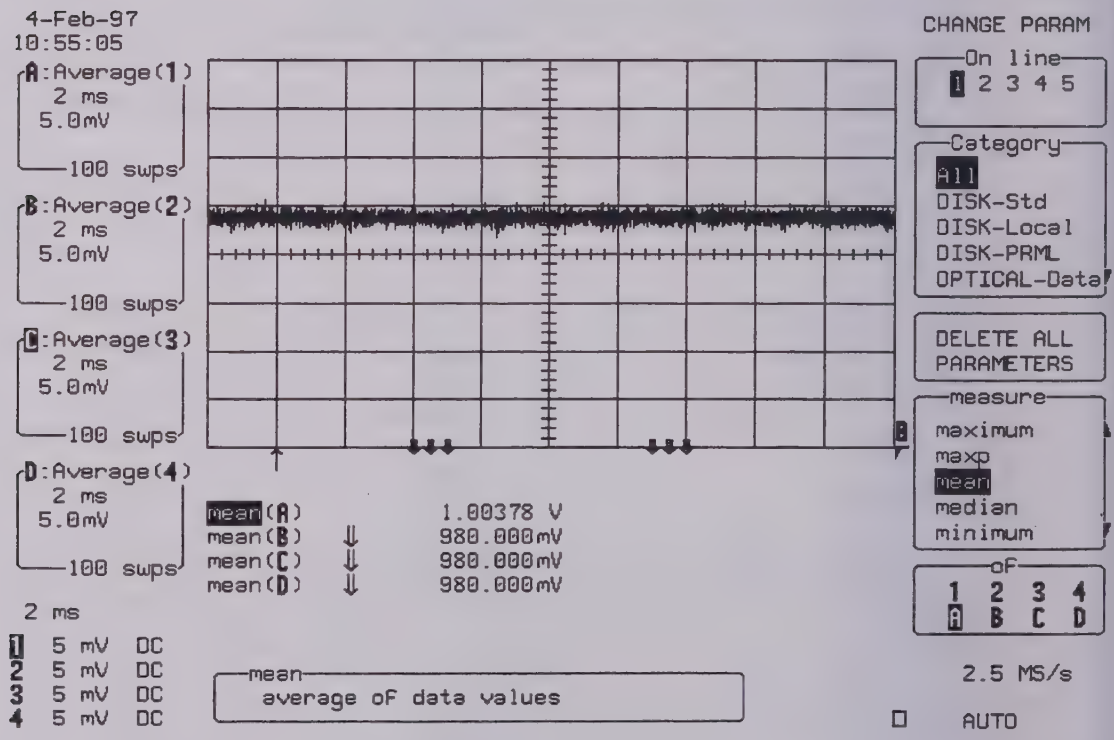
  Input offset : **–1 Volt**

- Connect the test equipment as shown in Figure 5-7.

- Set the output of the external **DC voltage reference source** to **+1 Volt**.

- Verify that the displayed trace A : Average (1) is in the screen, near to the center horizontal graticule line.

- Connect the DMM and record the **voltage reading** in Table 13, column **DMM**.
- Disconnect the DMM from the BNC T connector.
- Press **Clear Sweeps**
- After 100 sweeps, Read off the **DSO Mean parameter** voltage, and record the measurement in Table 13, column **Mean**.
- Calculate the **Difference (Δ)** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 13, and compare the **Difference (Δ)** to the corresponding limit in the test record.
- Repeat the test for the other channels, substituting channel controls and input connector. Record the measurements in Table 13.



5.9 Bandwidth

5.9.1 Description

The purpose of this test is to ensure that the entire system has a bandwidth of at least 1 GHz. An external source is used as the reference to provide a signal where amplitude and frequency are well controlled.
The amplitude of the generator as a function of frequency and power is calibrated using an HP8482A sensor on an HP436A power meter or equivalent.

Specifications

50Ω : DC to at least 1 GHz (–3 dB) at 10 mV/div. and above.

1MΩ : DC to 400 MHz typical at 100 mV/div

a. DC 50Ω

- Recall **574p036.PNL** or configure the DSO :

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channels Trace ON		**Channel 1, Channel 2, Channel 3 & Channel 4**
Input Coupling	:	**DC 50Ω** on all 4 Channels
Input gain	:	**50mV/div** on all 4 Channels
Input offset	:	**0 mV** on all 4 Channels
Trigger setup	:	**Edge**
Trigger on	:	**Line**
Slope line	:	**Pos**
Mode	:	**Auto**
Timebase	:	**10 µsec/div.**
Channel use	:	**4**
Record up	:	**50 k**
Cursors/Measure	:	**Parameters**
Mode	:	**Custom**
Statistics	:	**On**
Change parameters		
On line 1	:	**Sdev of 1**
On line 2	:	**Sdev of 2**
On line 3	:	**Sdev of 3**
On line 4	:	**Sdev of 4**

- Connect the HP8482A power sensor to the power meter.

- Zero and **calibrate** the HP8482A power sensor using the power meter **Power Ref output**.

- Connect a **BNC adapter** to the HP8482A power sensor.
- Connect a 5ns 50 BNC cable to the **RF output** of the HP8648B generator and then through the necessary adapters to the power sensor.

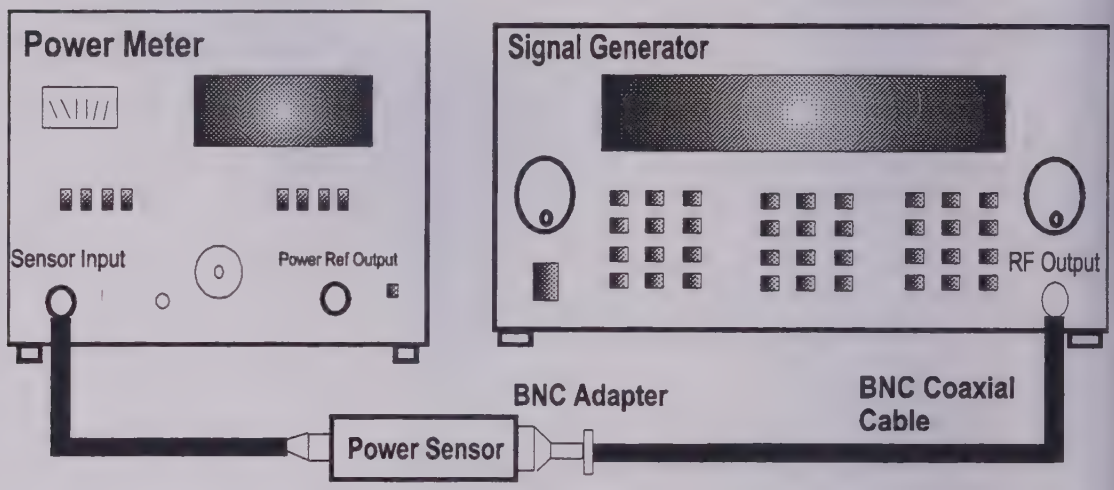


Figure 5-8 : Power Meter Equipment Setup

- Set the generator frequency to **300 KHz**
- Set the generator amplitude to measure **0.200 mW** on the power meter.
- Read the displayed **generator output amplitude,** and record it in the third column of Table 14.
- Repeat the above measurement for **1.1 MHz**, **30.1 MHz**, **250.1 MHz**, **750.1 MHz** & **1000.1 MHz**. Record the generator output amplitude readout in the third column of Table 14.
- Disconnect the **RF output** of the HP8648B generator from the HP8482A power sensor.
- Connect the **RF output** of the HP8648B generator through the 5ns 50 Ohm BNC cable into Channel 1.
- Set the generator frequency to **300 KHz**.
- From the generator, apply the **recorded generator signal amplitude** to Channel 1.
- Press **Clear Sweeps**.

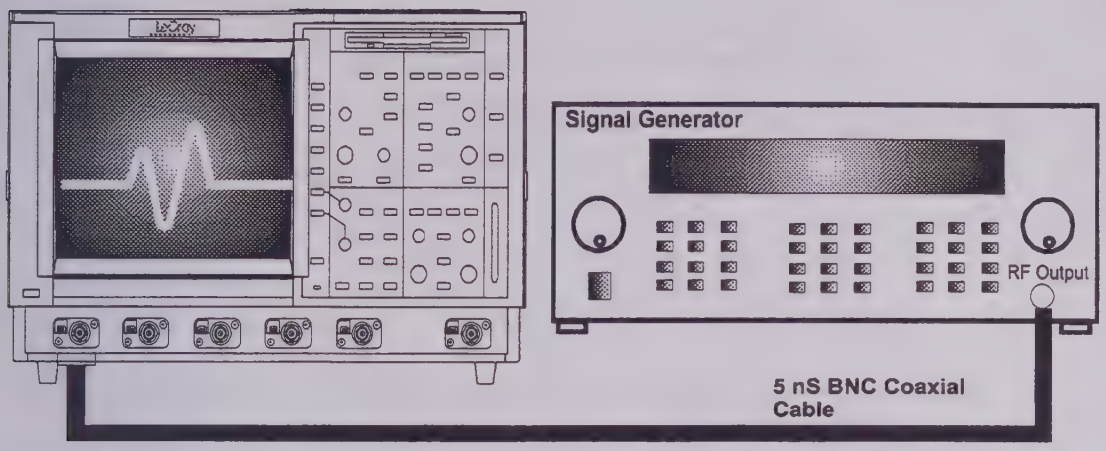

Figure 5-9 : 50Ω Bandwidth Equipment Setup

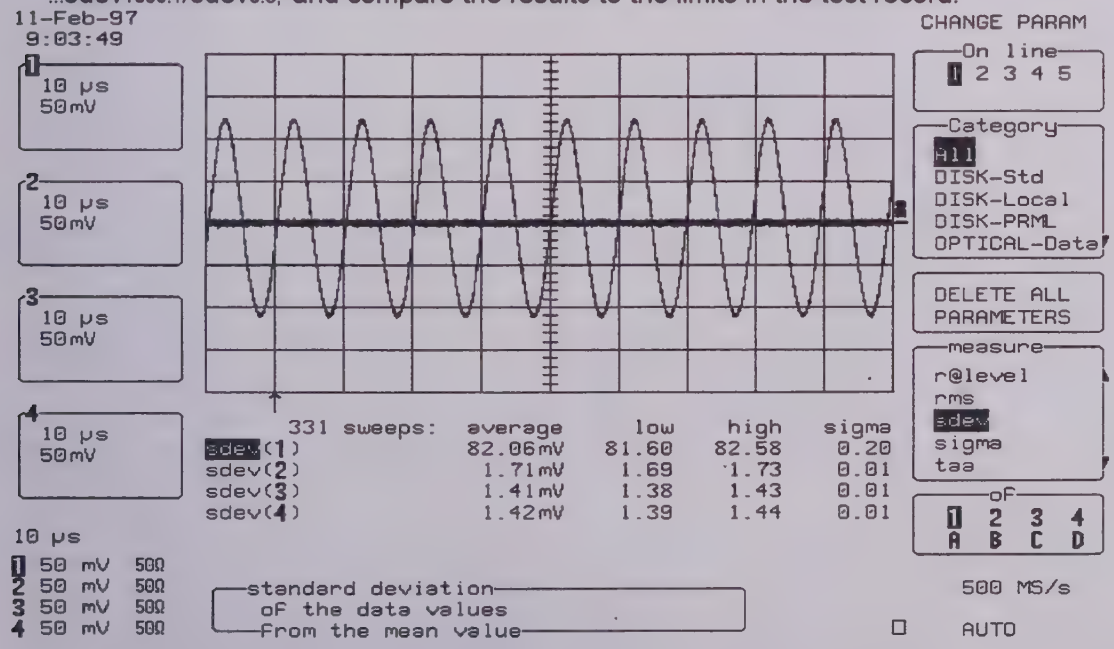
- Measure for at least 100 sweeps, record the average value of **sdev(1)** inTable14

- Repeat the above 3 steps for Channel 2, Channel 3 & Channel 4 substituting channel controls and input connector. Record the measurements in Table 14.

- Repeat the above measurement for all channels for 1.1 MHz, 30.1 MHz, 250.1 MHz, 750.1 MHz and 1000.1 MHz and record the values in Table 14.

- Calculate the ratio to .3 MHz for each frequency, $sdev_{1.1}/sdev_{0.3}$,$sdev_{30.1}/sdev_{0.3}$ ...$sdev_{1000.1}/sdev_{0.3}$, and compare the results to the limits in the test record.



- Recall **574p037.PNL** or configure the DSO as shown in 5.9.1.a. and for each Channel make the following change :

  Input gain : **100mV/div**

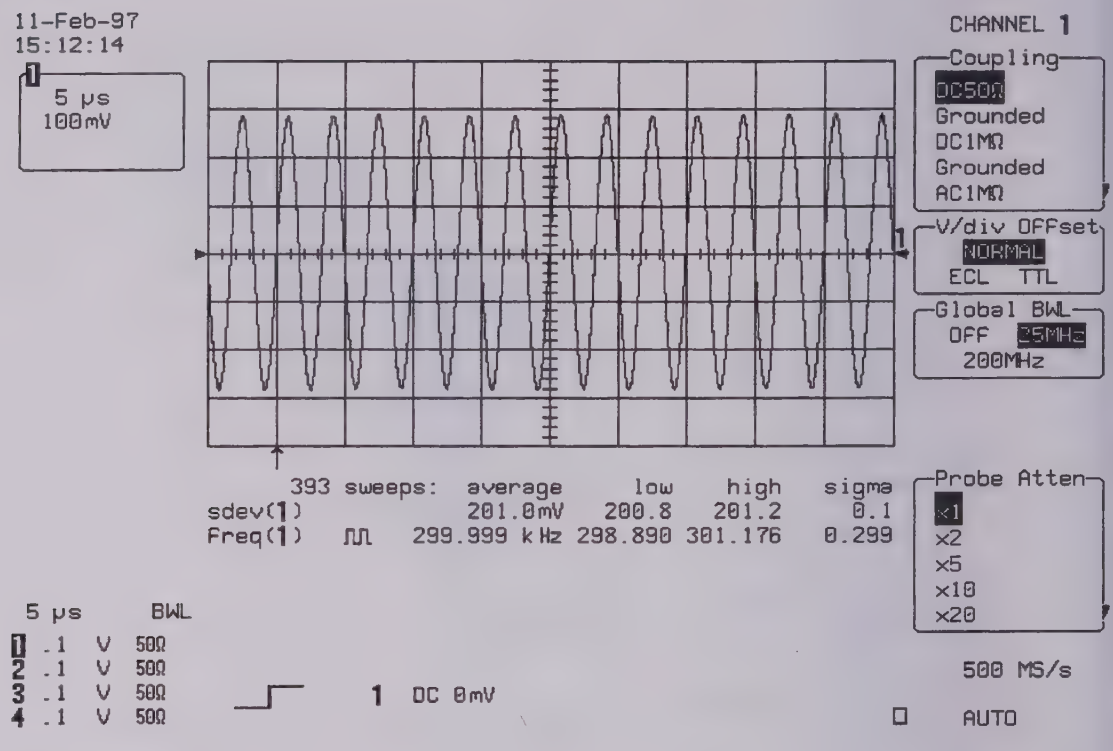
- Connect the test equipment as shown in Figure 5-8.
- Set the generator frequency to **300 kHz**
- Set the generator amplitude to measure **0.800 mW** on the power meter.
- Read the displayed **generator output amplitude,** and record it in the third column of Table 15.
- Repeat the above measurement for **1.1 MHz**, **30.1 MHz**, **250.1 MHz**, **750.1 MHz** & **1000.1 MHz**. Record the generator output amplitude readout in the third column of Table 15.
- Disconnect the **RF output** of the HP8648B generator from the HP8482A power sensor.
- Connect the test equipment as shown in Figure 5-9.
- Set the generator frequency to **300 kHz**.
- From the generator, apply the **recorded generator signal amplitude** to Channel 1.
- Press **Clear Sweeps**.
- Measure for at least 100 sweeps, record the average value of **sdev(1)** inTable15
- Repeat the above 3 steps for Channel 2, Channel 3 & Channel 4 substituting channel controls and input connector. Record the measurements in Table 15.
- Repeat the above measurement for all channels for 1.1 MHz, 30.1 MHz, 250.1 MHz, 750.1 MHz and 1000.1 MHz and record the values in Table 15.
- Calculate the ratio to .3 MHz for each frequency, $sdev_{1.1}/sdev_{0.3}$,$sdev_{30.1}/sdev_{0.3}$ ...$sdev_{1000.1}/sdev_{0.3}$, and compare the results to the limits in the test record.

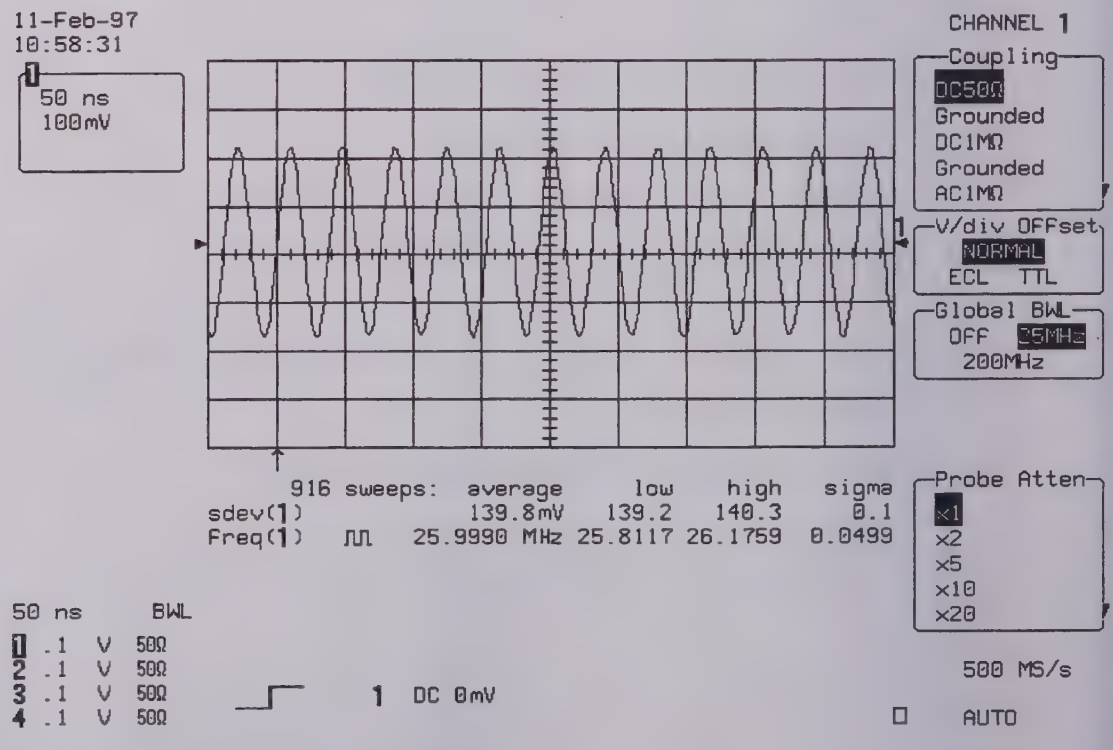
b. DC 50Ω with Bandwidth Limiter On

- Recall **574p038.PNL** or configure the DSO

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channels Trace ON		**Channel 1**
Input Coupling	:	**DC 50Ω**
Global BWL	:	**25 MHz**
Input gain	:	**100 mV/div.**
Input offset	:	**0 mV**
Trigger setup	:	**Edge**
Trigger on	:	**1**
Slope line	:	**Pos**
Mode	:	**Auto**
Timebase	:	**5 µsec/div.**
Channel use	:	**4**
Record up	:	**50 k**
Cursors/Measure	:	**Parameters**
Mode	:	**Custom**
Statistics	:	**On**
Change parameters		
On line 1	:	**Sdev of 1**
On line 2	:	**Freq of 1**

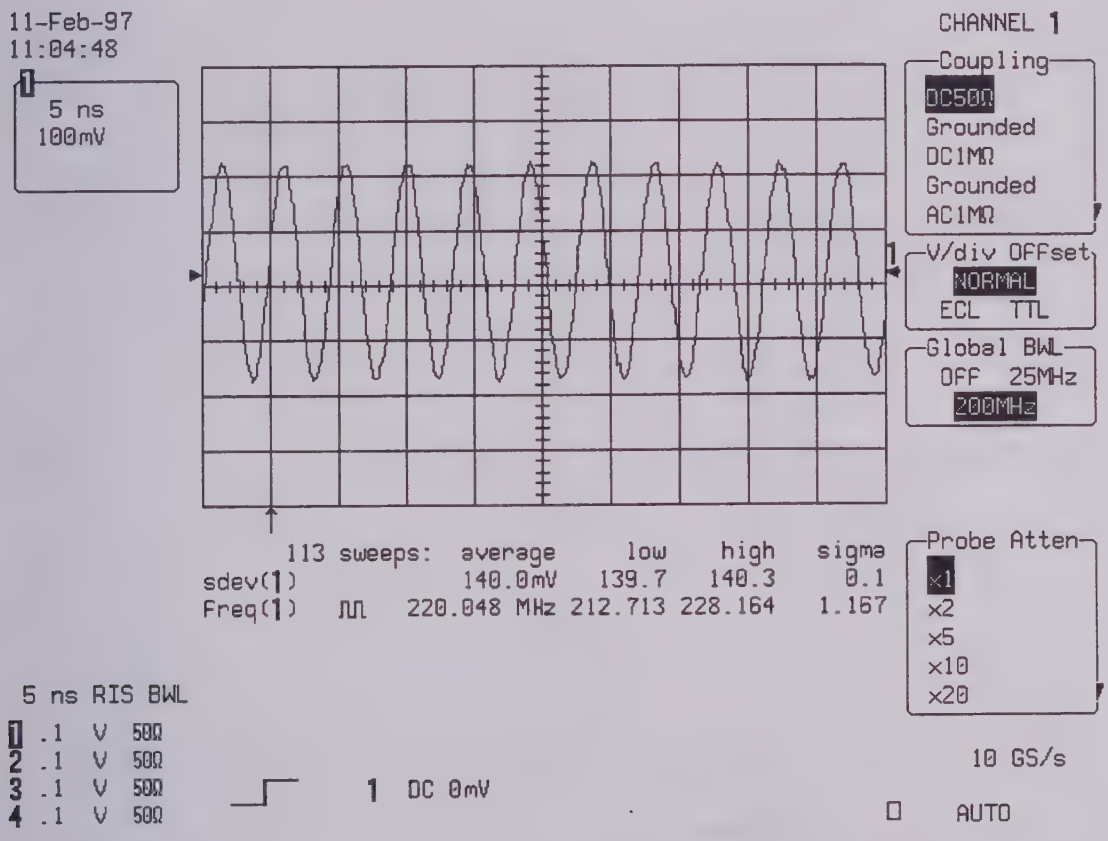
- Connect the test equipment as shown in Figure 5-9.
- Set the generator frequency to **300 kHz**.
- Adjust the generator signal amplitude to measure **sdev(1) = 200 mV.**
- Set Timebase : **50 nsec/div**.
- Increase the generator frequency until **sdev(1) = 140 mV.** (typically 25 MHz)
- Press **Clear Sweeps**
- When **sdev(1) = 140 mV,** record Freq(1) in Table 16.
- Check that the frequency is within the limits specified in Table 16.





- Set Global BWL : **200 MHz**

- Set Timebase : **5 nsec/div**.
- Increase the generator frequency until **sdev(1) = 140 mV.** (typically 200 MHz)



- Press **Clear Sweeps**
- When **sdev(1) = 140 mV,** record Freq(1) in Table 16.
- Repeat the 25 MHz and 200 MHz Bandwidth limiter tests for the other channels, substituting channel controls and input connector.
- Recall **574p039.PNL** for Channel 2, **574p040.PNL** for Channel3 **574p041.PNL** for Channel 4, or configure the DSO as shown in 5.9.1.b. and make the necessary changes.
- Record the test results in Table 16, and compare the results to the limits.

5.9.2 DC 1MΩ

- Recall **574p042.PNL** or configure the DSO :

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channels Trace ON		**Channel 1, Channel 2, Channel 3 & Channel 4**
Input Coupling	:	**DC 1MΩ** on all 4 Channels
Input gain	:	**100 mV/div.** on all 4 Channels
Input offset	:	**0 mV** on all 4 Channels
Trigger setup	:	**Edge**
Trigger on	:	**Line**
Slope line	:	**Pos**
Mode	:	**Auto**
Timebase	:	**10 µsec/div.**
Channel use	:	**4**
Record up	:	**50 k**
Cursors/Measure	:	**Parameters**
Mode	:	**Custom**
Statistics	:	**On**
Change parameters		
On line 1	:	**Sdev of 1**
On line 2	:	**Sdev of 2**
On line 3	:	**Sdev of 3**
On line 4	:	**Sdev of 4**

- Connect the test equipment as shown in Figure 5-10.

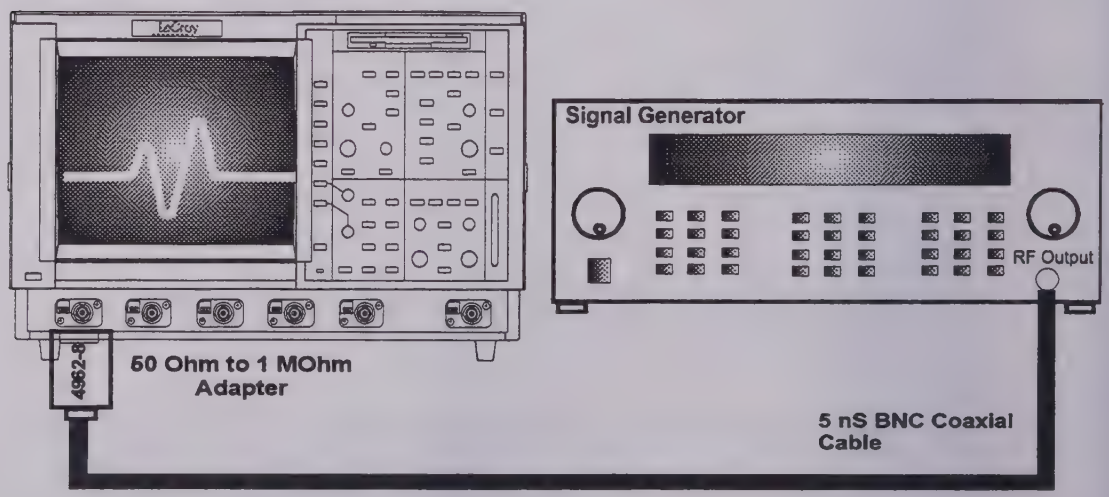


Figure 5-10 : 1MΩ Bandwidth Equipment Setup

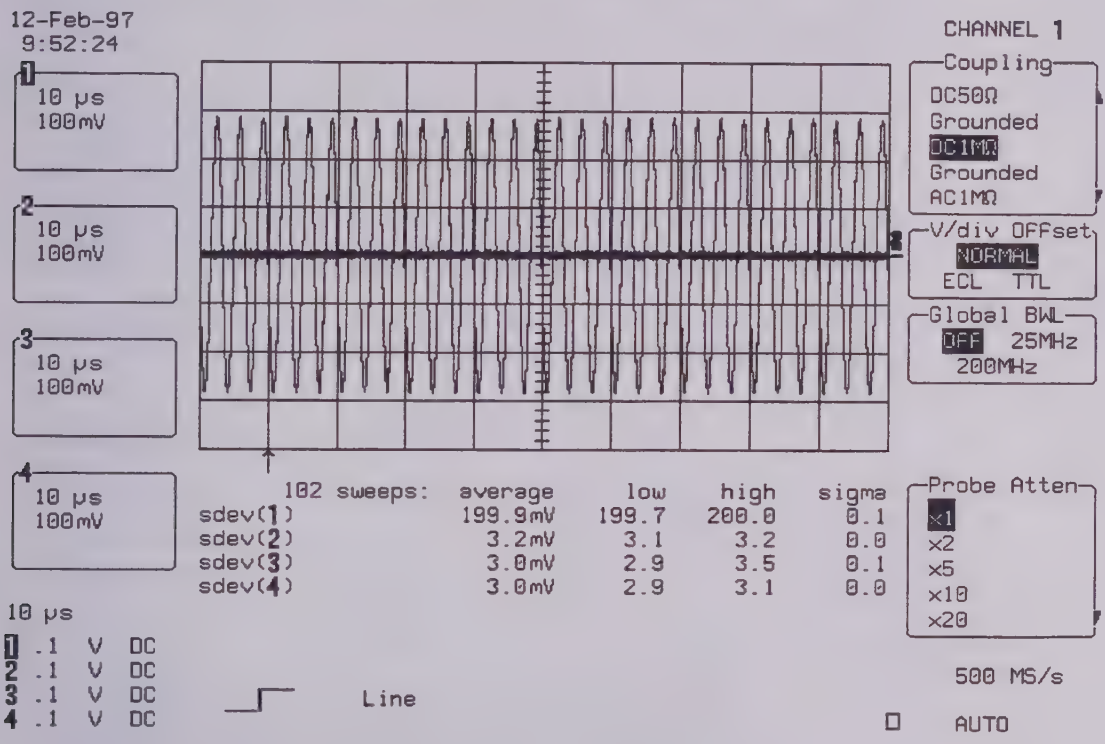
- Set the generator frequency to **300 kHz**.
- Adjust the generator signal amplitude to measure **sdev(1) = 200 mV.**



- Disconnect the coaxial cable from the 4962-9 adapter. Connect the test equipment as shown in Figure 5-11.

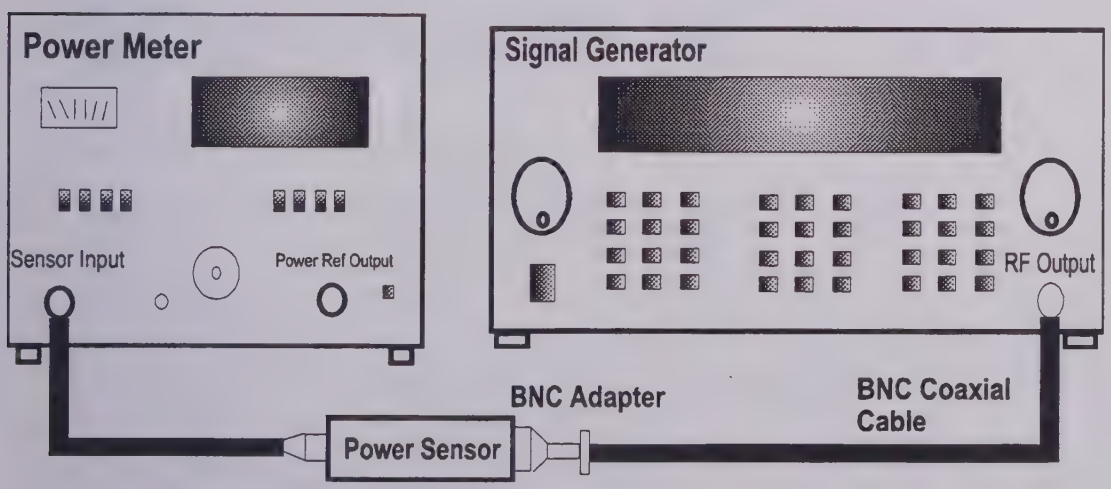


Figure 5-11 : Power Meter Equipment Setup

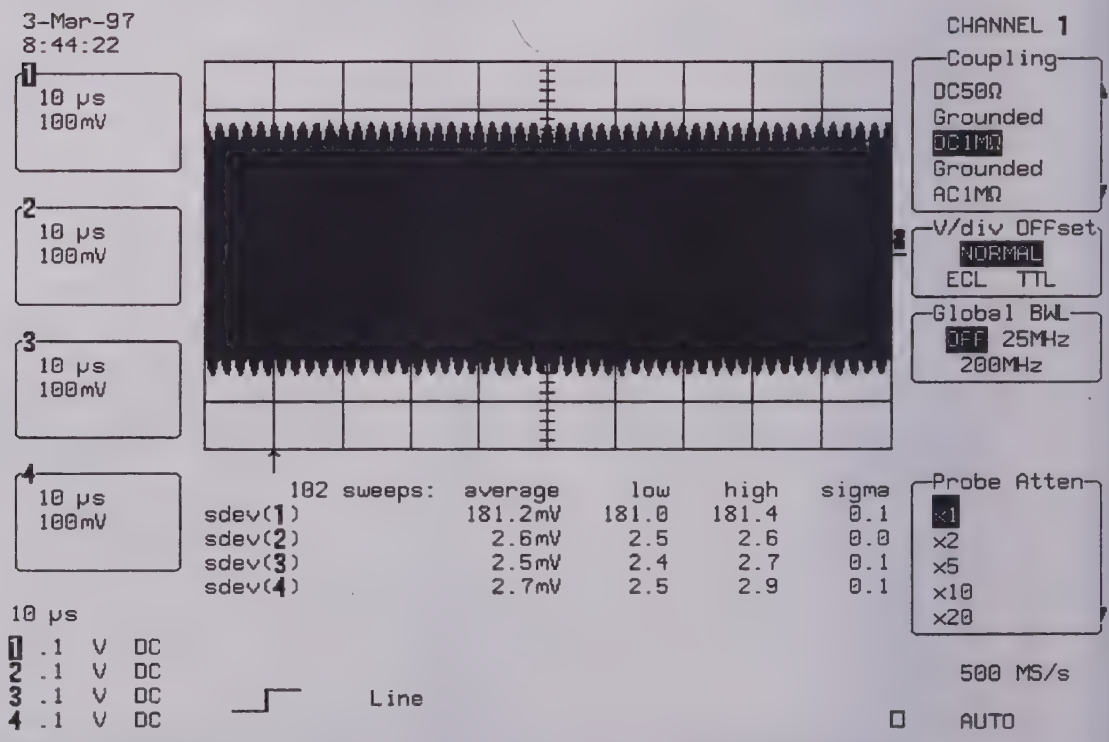
- Record the displayed power meter value in mW.

- Set the generator frequency to **400.1 MHz**.
- Now fine adjust the generator amplitude output until the power meter readout indicates the value measured just above at 300 kHz.
- Reconnect the signal generator to DSO Channel 1, as shown in Figure 5-10.
- Press **Clear Sweeps**.
- Measure for at least **100 sweeps**, record the average value of **sdev(1)** in Table17.
- Repeat the above steps for Channel 2, Channel 3 & Channel 4, substituting channel controls and input connector.
- Record the sdev measurements in Table17.
- Calculate the ratio **sdev400.1/sdev0.3** for each Channel, and test each value against the limits shown in the test record.



5.10 Trigger Level

5.10.1 Description

The trigger capabilities are tested for several cases of the standard edge trigger :

- Channel (internal), and External Trigger sources
- Three DC levels : –3, 0, +3 major screen divisions
- DC, HFREJ coupling
- Positive and negative slopes

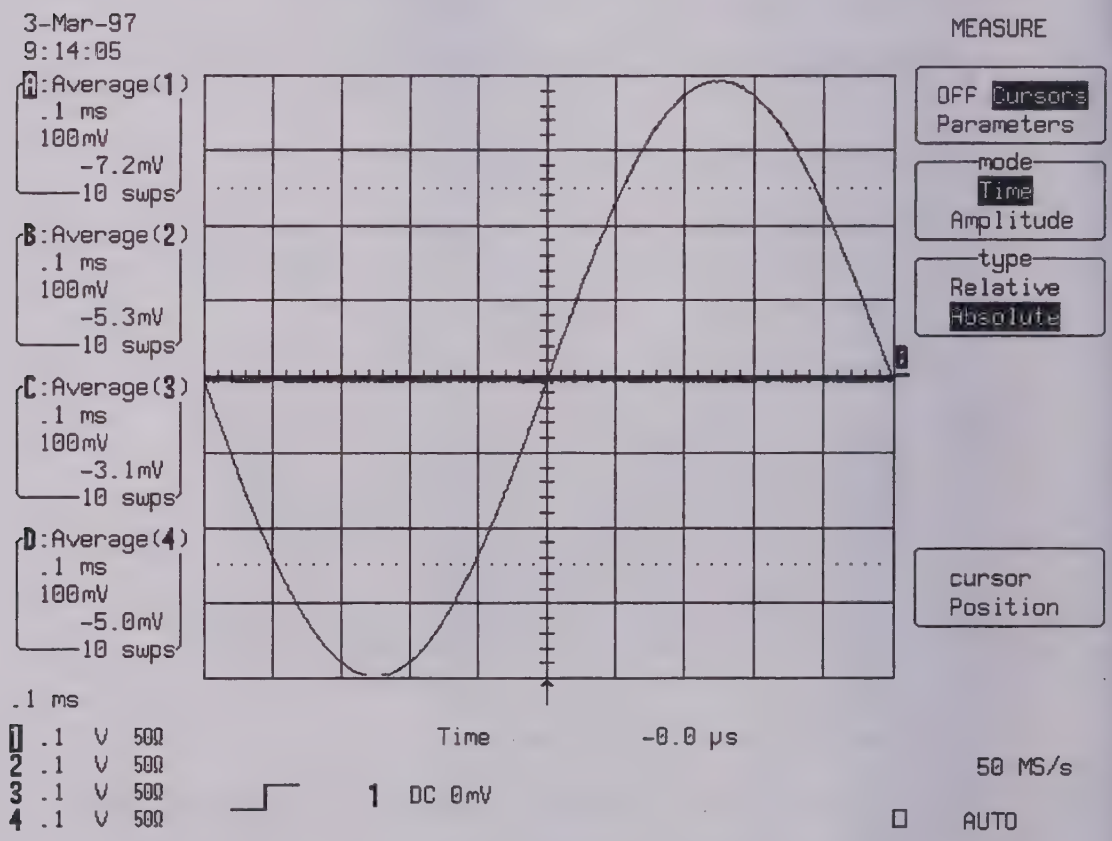
5.10.2 Channel Trigger at 0 Division Threshold

a. DC Coupling

Recall **574p043.PNL** or configure the DSO :

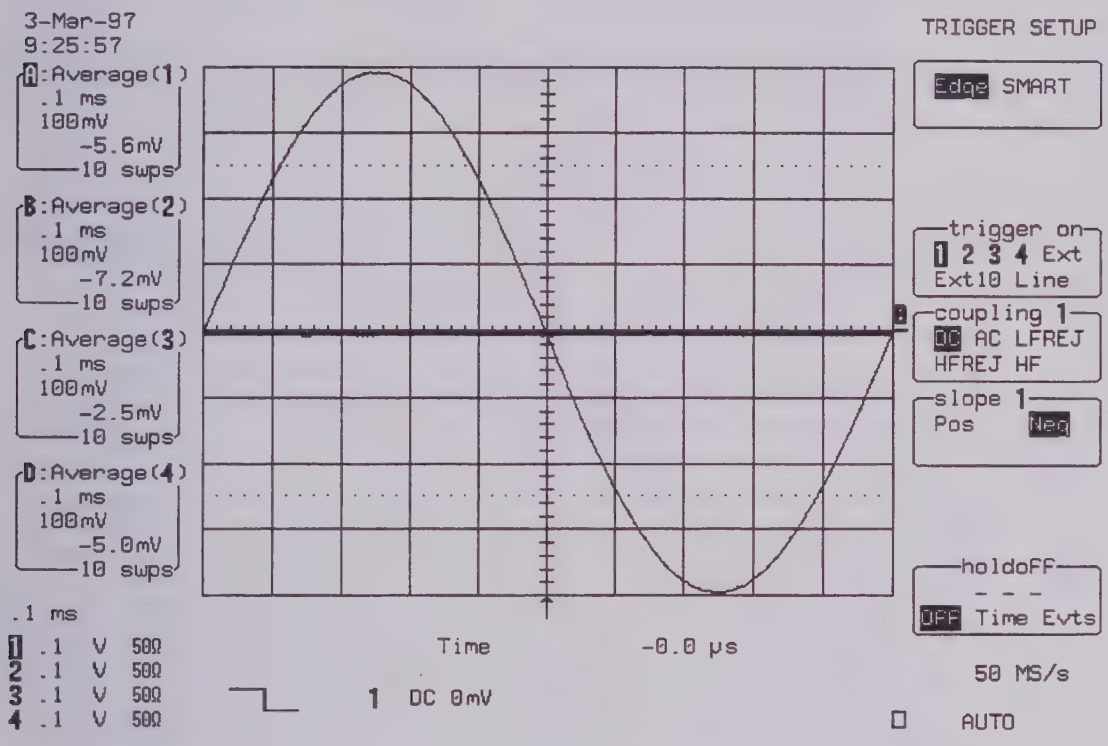
Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channels Trace ON		**Channel 1, Channel 2, Channel 3 & Channel 4**
Input Coupling	:	**DC 50Ω** on all 4 Channels
Input gain	:	**100 mV/div.** on all 4 Channels
Input offset	:	**0 mV** on all 4 Channels (use show status to verify)
Trigger setup	:	**Edge**
Trigger on	:	**1**
Slope 1	:	**Pos**
Coupling	:	**DC**
Mode	:	**Auto**
Set Trigger level	:	**DC 0.0 mV**
Pre-Trigger Delay	:	**50 %**
Timebase	:	**0.1 msec/div.**
Record up to	:	**50 k samples**
Channels Trace OFF		**Channel 1, Channel 2, Channel 3 & Channel 4**
Zoom+Math Trace ON		**A, B, C & D**
Select Math Setup		
For Math	:	**Use at most 5000 points**
Redefine A, B, C, D		**Channel 1, Channel 2, Channel 3 & Channel 4**
Use Math ?	:	**Yes**
Math Type	:	**Average**
Avg. Type	:	**Summed**
For	:	**10 sweeps**

- Set the output of the LeCroy LW420 or equivalent audio frequency signal generator to **1 kHz.**
- Connect the output of the generator to Channel 1 through a 50 Ohm coaxial cable and adjust the sine wave output amplitude to get **8 divisions peak to peak .**
- Select Cursors/Measure : **Cursors, Time, Absolute**
- Use the "cursor position" knob, to move the **Time marker** at 0.0 µs



- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 18 the **level** readout displayed below 100 mV in the icon **1**, at top left.
- Compare the test results to the corresponding limit in the test record.
- Set Trigger Slope 1 : **Neg**

- Acquire 10 sweeps and record in Table 18 the **level** readout displayed below 100 mV in the icon **1,** at top left.



b. HFREJ Coupling

- Set Coupling : **HFREJ**

- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below 100 mV in the icon **1,** at top left.

- Set Trigger Slope 1 : **Pos**

- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below 100 mV in the icon **1,** at top left.

- Repeat steps 5.10.2.a. and 5.10.2.b. for all input channels, substituting channel controls (DC, HFREJ, Pos, Neg) and input connector.
  Recall **574p044.PNL** for Channel 2, **574p045.PNL** for Channel 3, **574p046.PNL** for Channel 4, or select **Trigger on** the Channel under test.
  The **Trigger level** is displayed in either the icon **2**, **3** or **4**

- Record the measurements in Table 18 & 19 and compare the test results to the corresponding limits in the test record.

5.10.3 Channel Trigger at +3 Divisions Threshold

a. DC Coupling

- Recall **574p047.PNL** or configure the DSO as shown in 5.10.2.a and for each Channel make the following change :

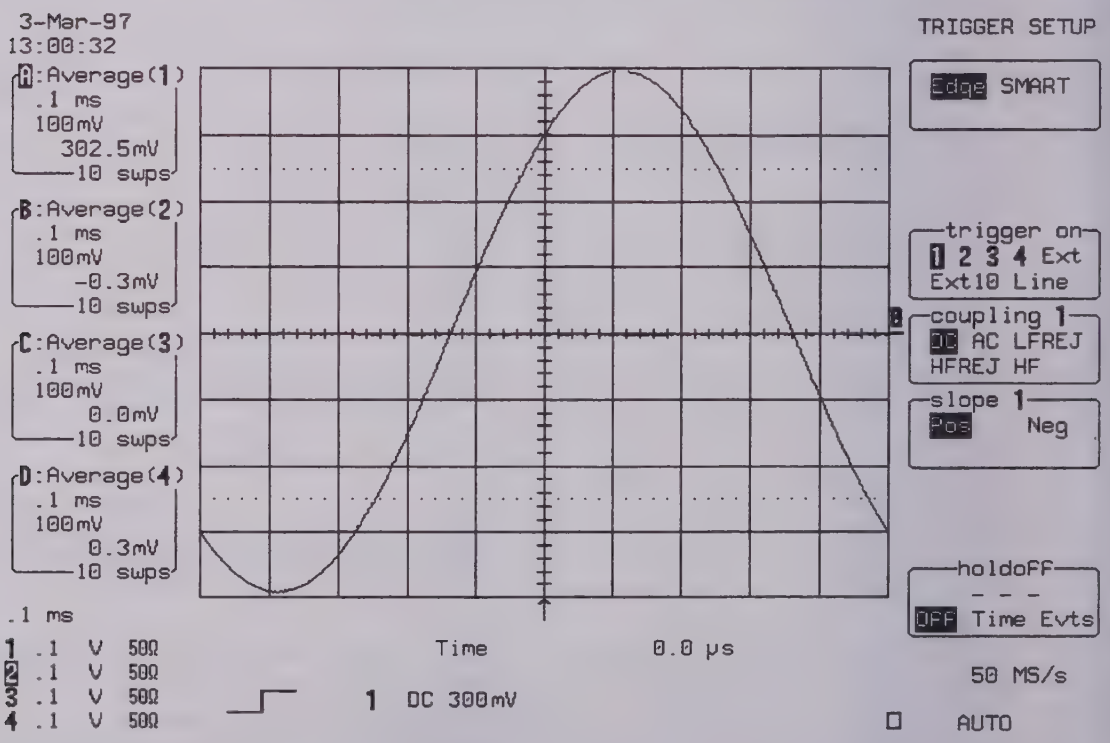
  Set Trigger level : **DC +300 mV**

- Connect the output of the generator to Channel 1 through a 50 Ohm coaxial cable.

- Press **Clear Sweeps**,

- Acquire 10 sweeps and record in Table 18 the **level** readout displayed below 100 mV in the icon **1**, at top left.

- Compare the test results to the corresponding limit in the test record.



- Set Trigger Slope 1 : **Neg**

- Acquire 10 sweeps and record in Table 18 the **level** readout displayed below 100 mV in the icon **1**, at top left.

b. HFREJ Coupling

- Set Coupling : **HFREJ**
- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below 100 mV in the icon **1**, at top left.

- Set Trigger Slope 1 : **Pos**
- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below 100 mV in the icon **1**, at top left.
- Repeat steps 5.10.3.a. and 5.10.3.b. for all input channels, substituting channel controls (DC, HFREJ, Pos, Neg) and input connector.
  Recall **574p048.PNL** for Channel 2, **574p049.PNL** for Channel 3, **574p050.PNL** for Channel 4, or select **Trigger on** the Channel under test.
  The **Trigger level** is displayed in either the icon **2**, **3** or **4**
- Record the measurements in Table 18 & 19 and compare the test results to the corresponding limits in the test record.

5.10.4 Channel Trigger at –3 Divisions Threshold

a. DC Coupling

- Recall **574p051.PNL** or configure the DSO as shown in 5.10.2.a and for each channel make the following change :

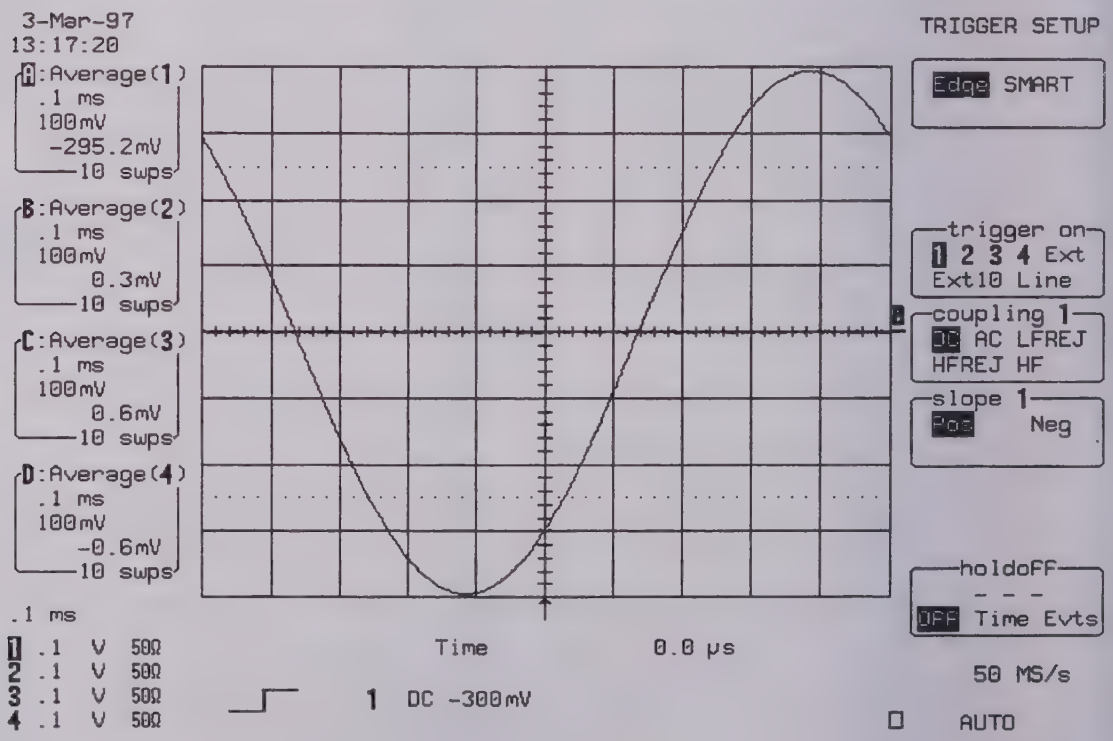
  Set Trigger level : **DC –300 mV**

- Connect the output of the generator to Channel 1 through a 50 Ohm coaxial cable.

- Press **Clear Sweeps**,

- Acquire 10 sweeps and record in Table 18 the **level** readout displayed below 100 mV in the icon **1**, at top left.

- Compare the test results to the corresponding limit in the test record.

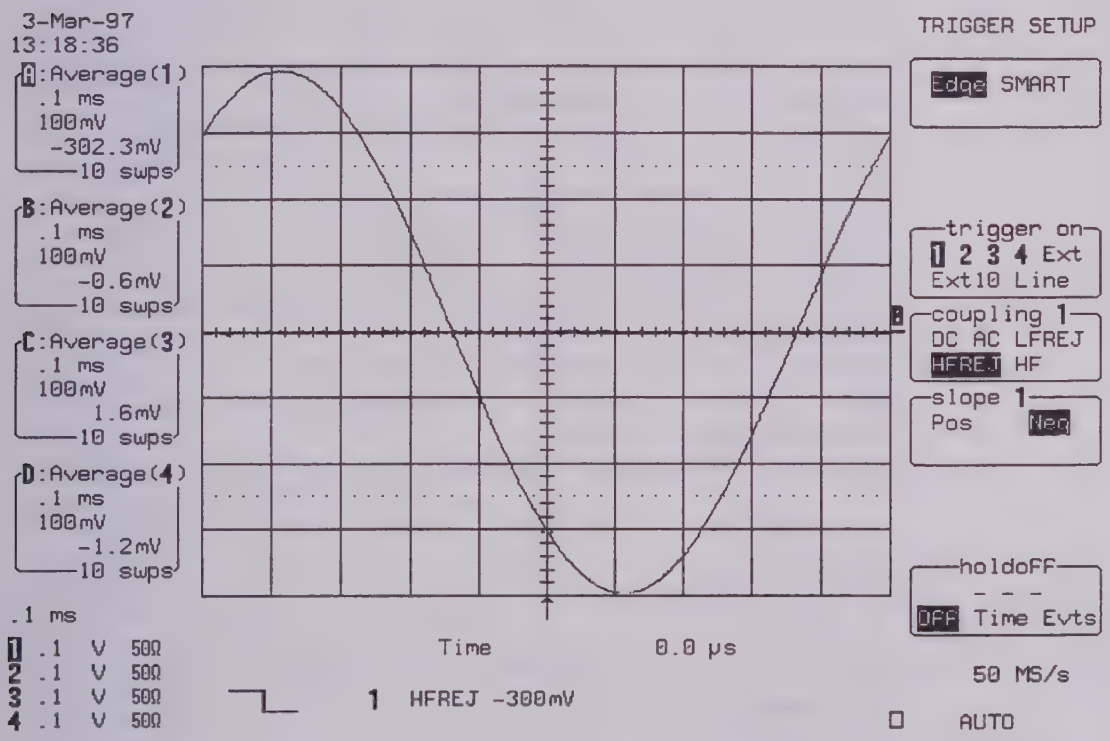


- Set Trigger Slope 1 : **Neg**

- Acquire 10 sweeps and record in Table 18 the **level** readout displayed below 100 mV in the icon **1**, at top left.

b. HFREJ Coupling

- Set Coupling : **HFREJ**
- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below 100 mV in the icon **1**, at top left.



- Set Trigger Slope 1 : **Pos**
- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below 100 mV in the icon **1**, at top left.
- Repeat steps 5.10.4.a. and 5.10.4.b. for all input channels, substituting channel controls (DC, HFREJ, Pos, Neg) and input connector.
  Recall **574p052.PNL** for Channel 2, **574p053.PNL** for Channel 3, **574p054.PNL** for Channel 4, or select **Trigger on** the Channel under test.
  The **Trigger level** is displayed in either the icon **2**, **3** or **4**
- Record the measurements in Table 18 & 19 and compare the test results to the corresponding limits in the test record.

5.10.5 External Trigger at 0 Division Threshold

a. DC Coupling

- Recall **574p055.PNL** or configure the DSO :

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channel Trace ON		**Channel 2**
Input Coupling	:	**DC 50Ω**
Input gain	:	**100 mV/div.**
Input offset	:	**0 mV**
Trigger setup	:	**Edge**
Trigger on	:	**Ext**
Slope Ext	:	**Pos**
Coupling Ext	:	**DC**
Set Trigger level	:	**0.0 mV**
External	:	**DC 1MΩ**
Mode	:	**Auto**
Pre-Trigger Delay	:	**50 %**
Timebase	:	**0.1 msec/div.**
Record up to	:	**50 k samples**
Channel Trace OFF		**Channel 2**
Zoom+Math Trace ON		**B**
Select Math Setup		
For Math	:	**Use at most 5000 points**
Redefine B	:	**Channel 2**
Use Math ?	:	**Yes**
Math Type	:	**Average**
Avg. Type	:	**Summed**
For	:	**10 sweeps**

- Connect the test equipment as shown in Figure 5-12.
- Set the output of the LeCroy LW420 or equivalent audio frequency signal generator to **1 kHz.**
- Adjust the sine wave output amplitude to get **8 divisions peak to peak .**
- Select Cursors/Measure : **Cursors, Time, Absolute**
- Use the "cursor position" knob, to move the **Time marker** at 0.0 μs

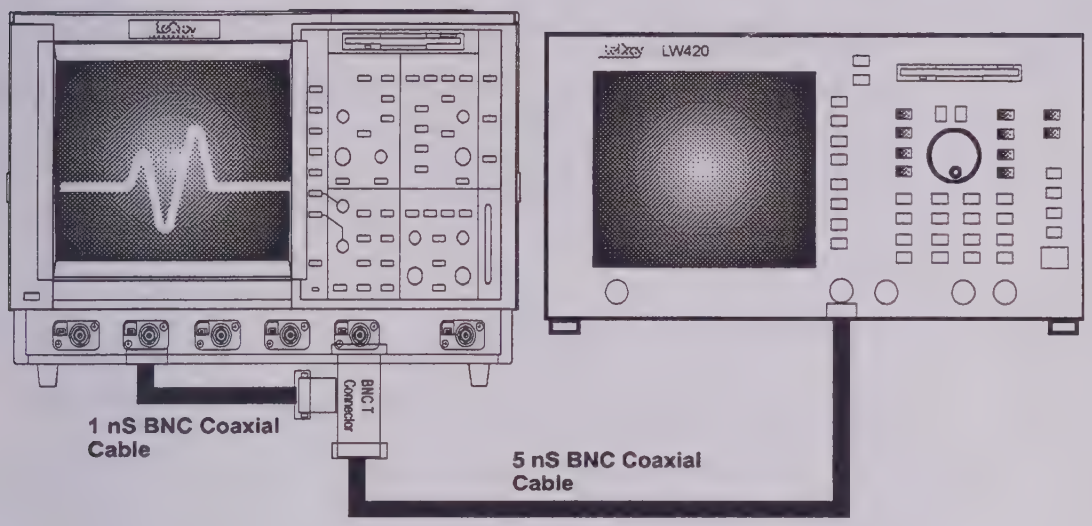


Figure 5-12 : External Trigger Equipment Setup

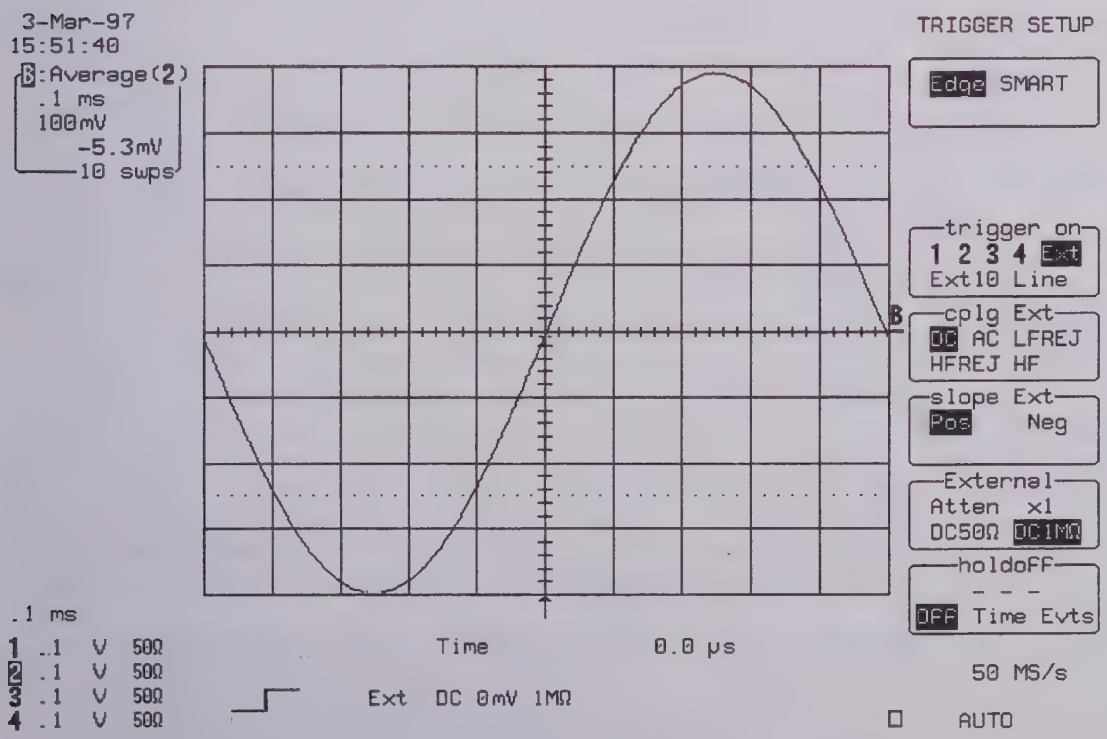
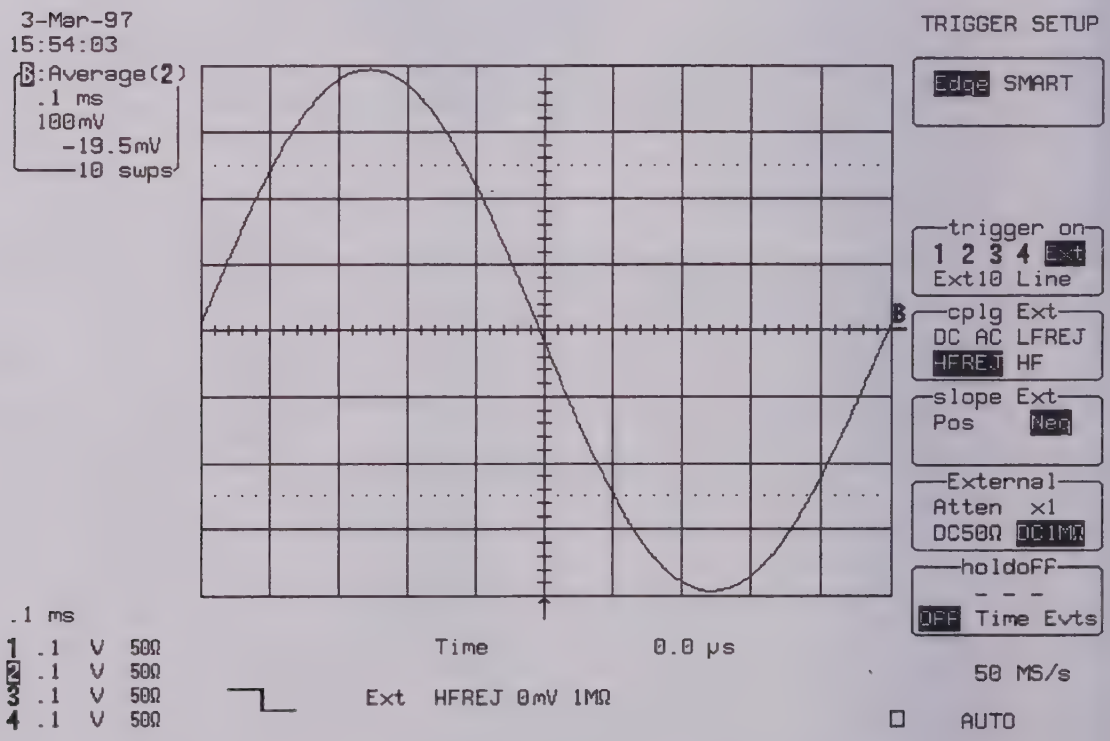
- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.



- Set Trigger Slope Ext : **Neg**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

b. HFREJ Coupling

- Set Coupling Ext : **HFREJ**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.



- Set Trigger Slope Ext : **Pos**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

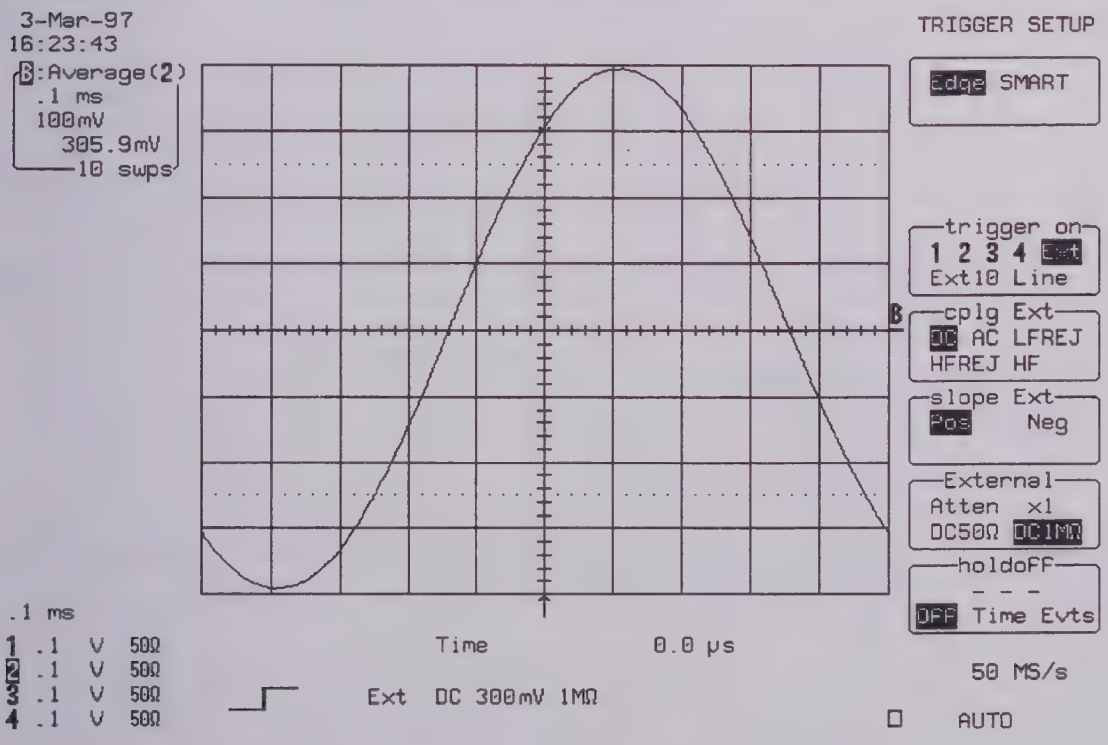
5.10.6 External Trigger at +3 Divisions Threshold

a. DC Coupling

- Recall **574p056.PNL** or configure the DSO as shown in 5.10.5.a and make the following change :

  Set Ext Trigger level : **DC +300 mV**

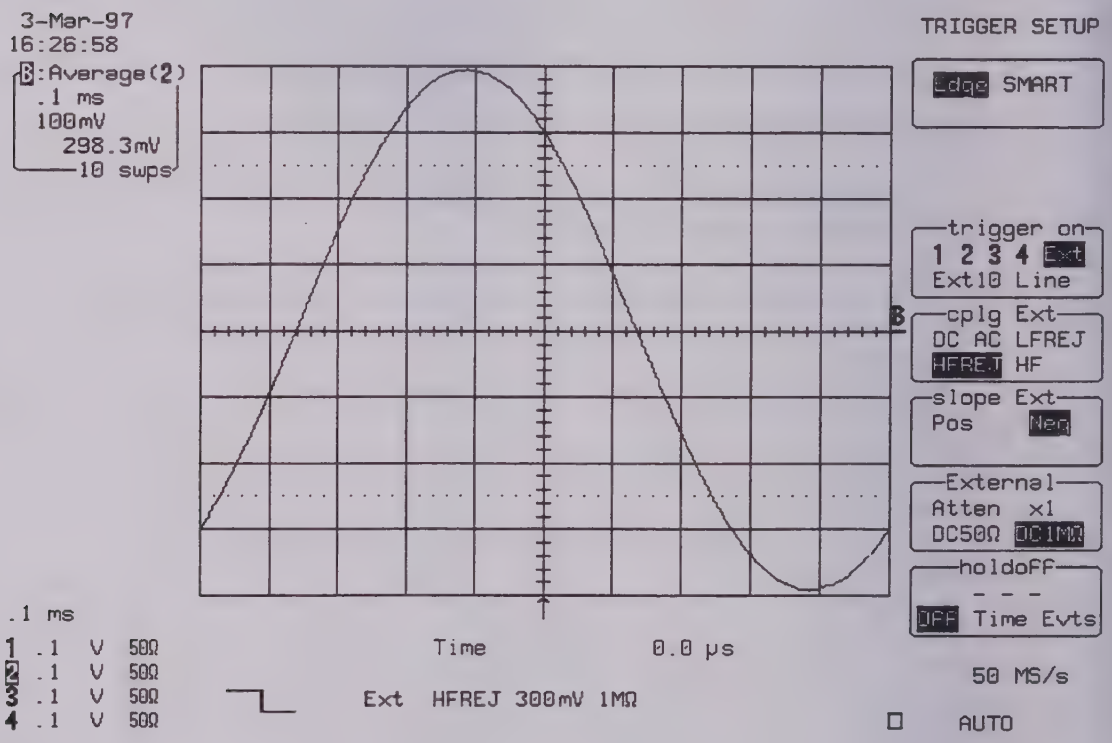
- Connect the test equipment as shown in Figure 5-12.
- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.



- Set Trigger Slope Ext : **Neg**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.

b. HFREJ Coupling

- Set Ext Coupling : **HFREJ**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.



- Set Trigger Slope Ext : **Pos**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.

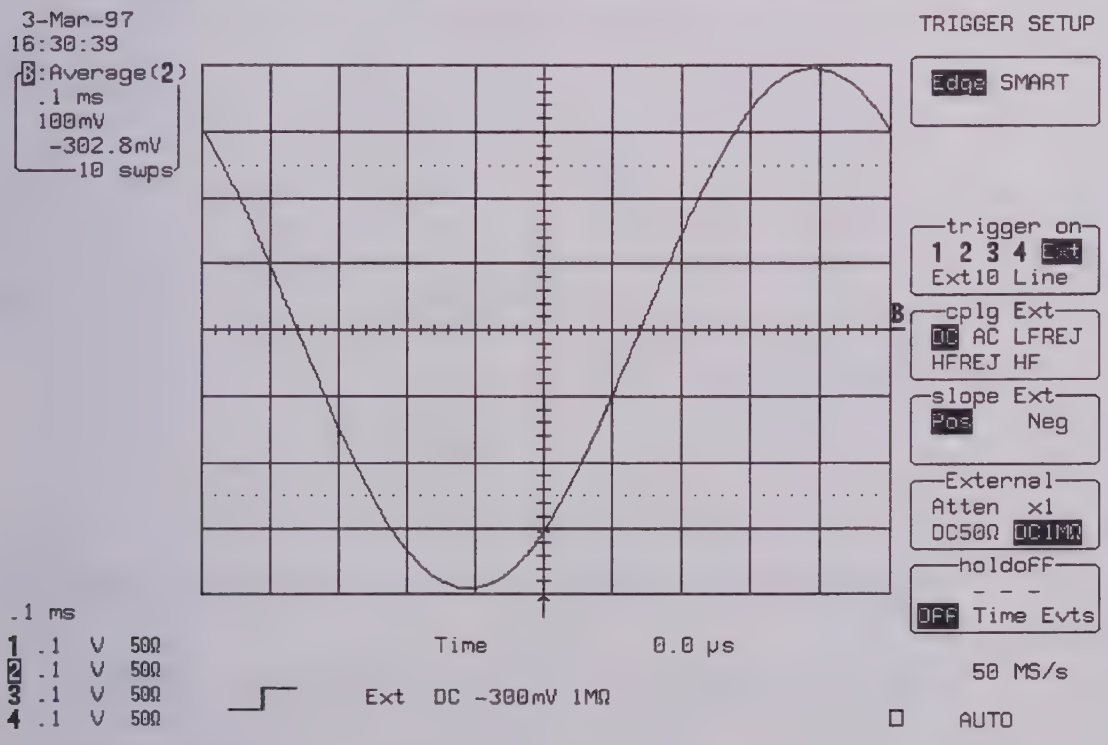
5.10.7 External Trigger at –3 Divisions Threshold

a. DC Coupling

- Recall **574p057.PNL** or configure the DSO as shown in 5.10.5.a and make the following change :

  Set Ext Trigger level : **DC –300 mV**

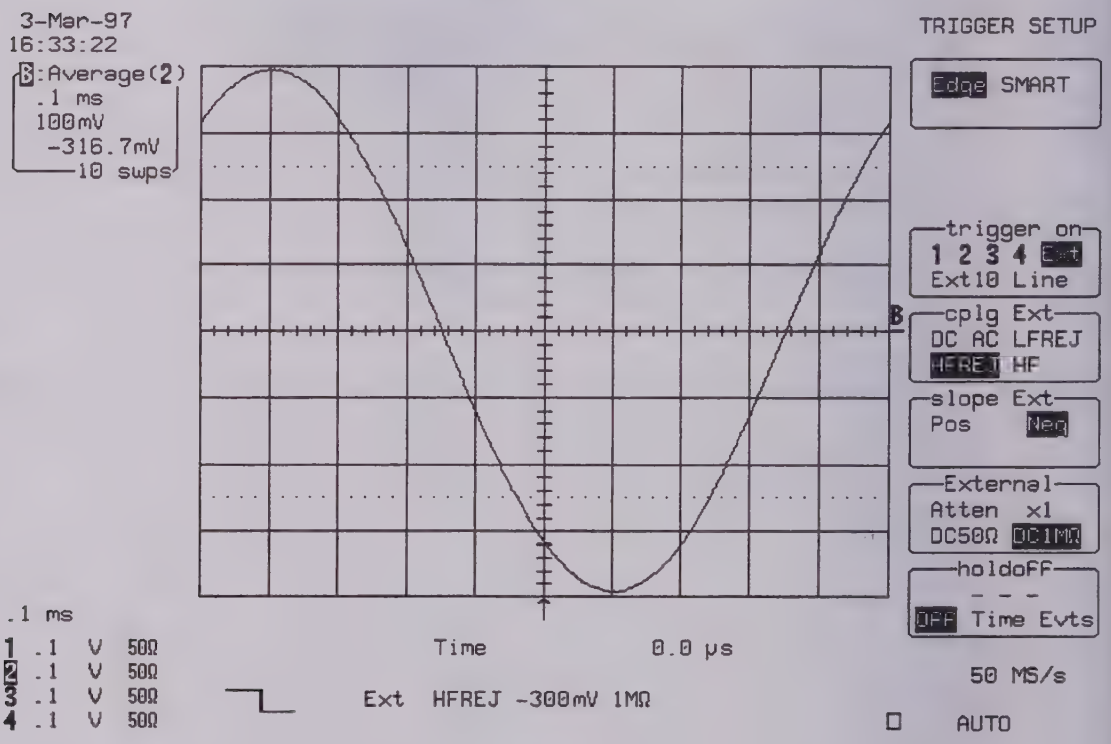
- Connect the test equipment as shown in Figure 5-12.
- Press **Clear Sweeps**.
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.



- Set Trigger Slope Ext : **Neg**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.

b. HFREJ Coupling

- Set Ext Coupling : **HFREJ**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.



- Set Trigger Slope Ext : **Pos**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

5.10.8 External/10 Trigger at 0 Division Threshold

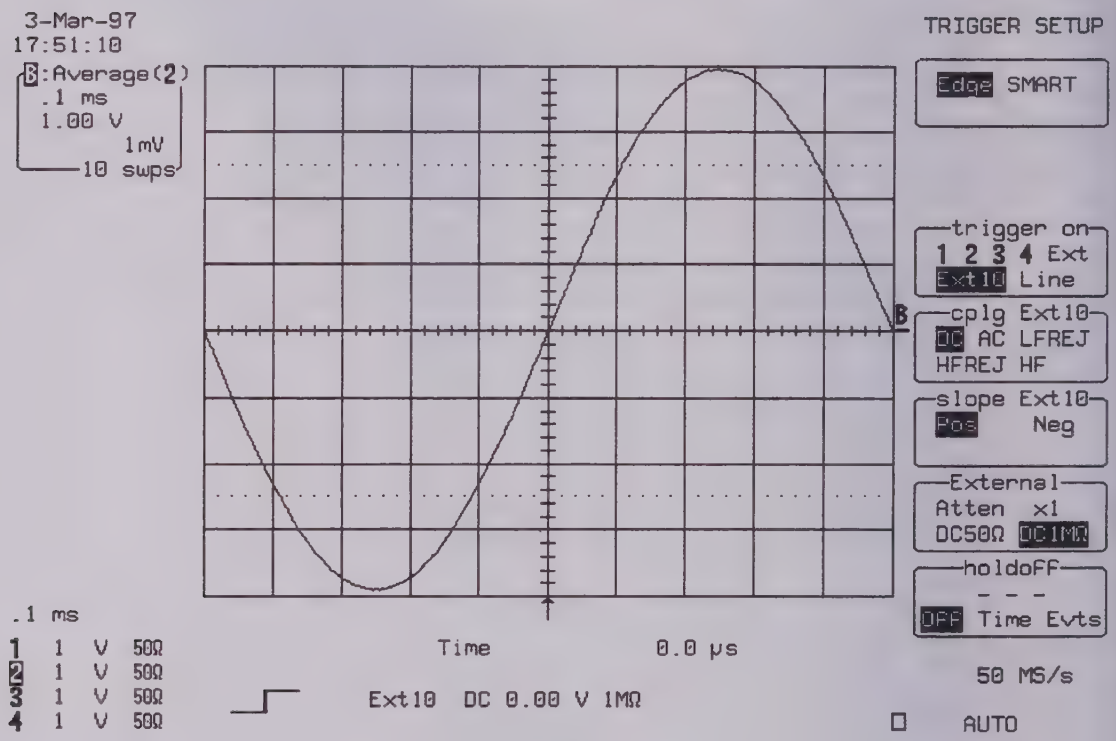
a. DC Coupling

- Recall **574p058.PNL** or configure the DSO :

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channel Trace ON		**Channel 2**
Input Coupling	:	**DC 50Ω**
Input gain	:	**1V/div**
Input offset	:	**0 mV**
Trigger setup	:	**Edge**
Trigger on	:	**Ext/10**
Slope Ext/10	:	**Pos**
Mode	:	**Auto**
Coupling	:	**DC**
Set Trigger level	:	**0.0 mV**
External	:	**DC 1MΩ**
Pre-Trigger Delay	:	**50 %**
Timebase	:	**0.1 msec/div.**
Record up to	:	**50 k samples**
Channel Trace OFF		**Channel 2**
Zoom+Math Trace ON		**B**
Select Math Setup		
For Math	:	**Use at most 5000 points**
Redefine B	:	**Channel 2**
Use Math ?	:	**Yes**
Math Type	:	**Average**
Avg. Type	:	**Summed**
For	:	**10 sweeps**

- Connect the test equipment as shown in Figure 5-12.
- Set the output of the LeCroy LW420 or equivalent audio frequency signal generator to **1 kHz.**
- Adjust the sine wave output amplitude to get **8 divisions peak to peak .**
- Select Cursors/Measure : **Cursors, Time, Absolute**
- Use the "cursor position" knob, to move the **Time marker** at 0.0 μs

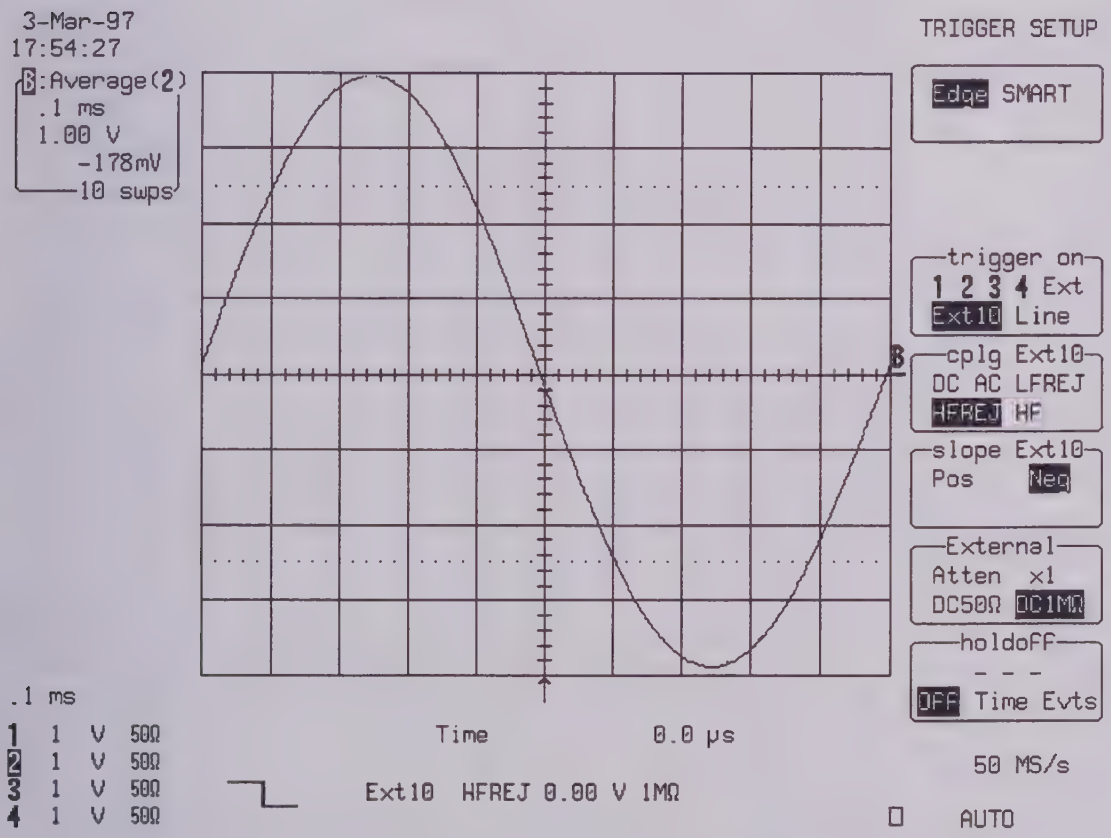
- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.



- Set Trigger Slope Ext/10 : **Neg**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

b. HFREJ Coupling

- Set Coupling Ext/10 : **HFREJ**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.



- Set Trigger Slope Ext/10 : **Pos**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

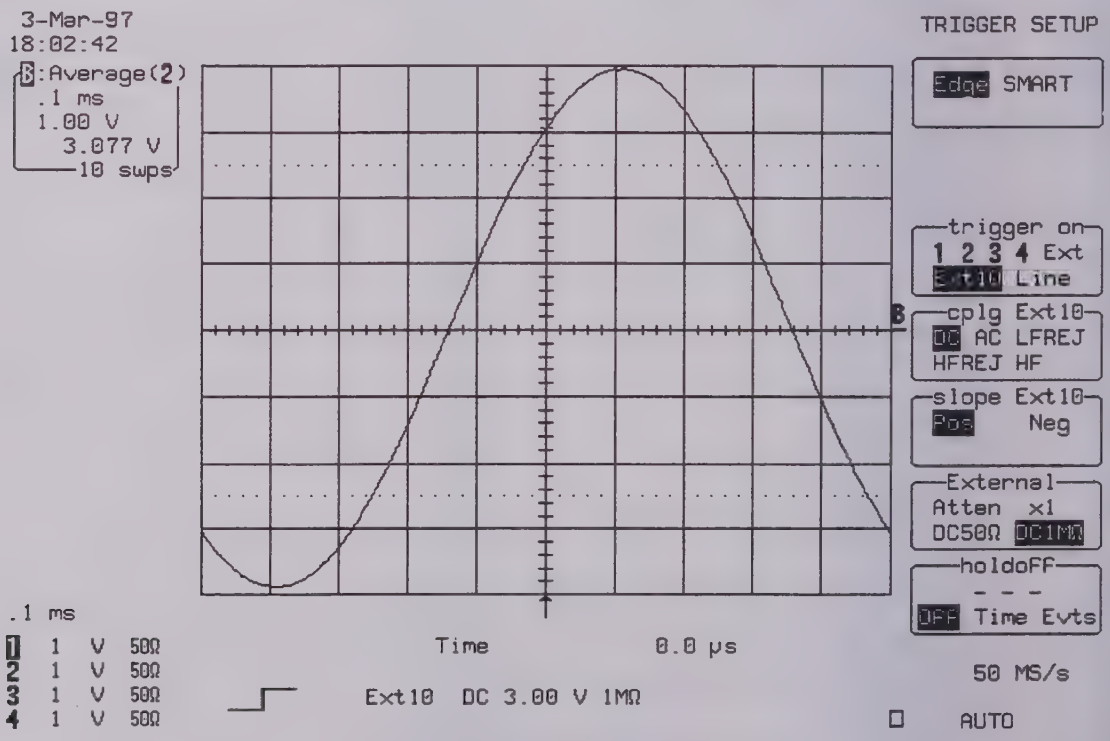
5.10.9 External/10 Trigger at +3 Divisions Threshold

a. DC Coupling

- Recall **574p059.PNL** or configure the DSO as shown in 5.10.8.a and make the following change :

  Set Ext/10 Trigger level : **DC +3 V**

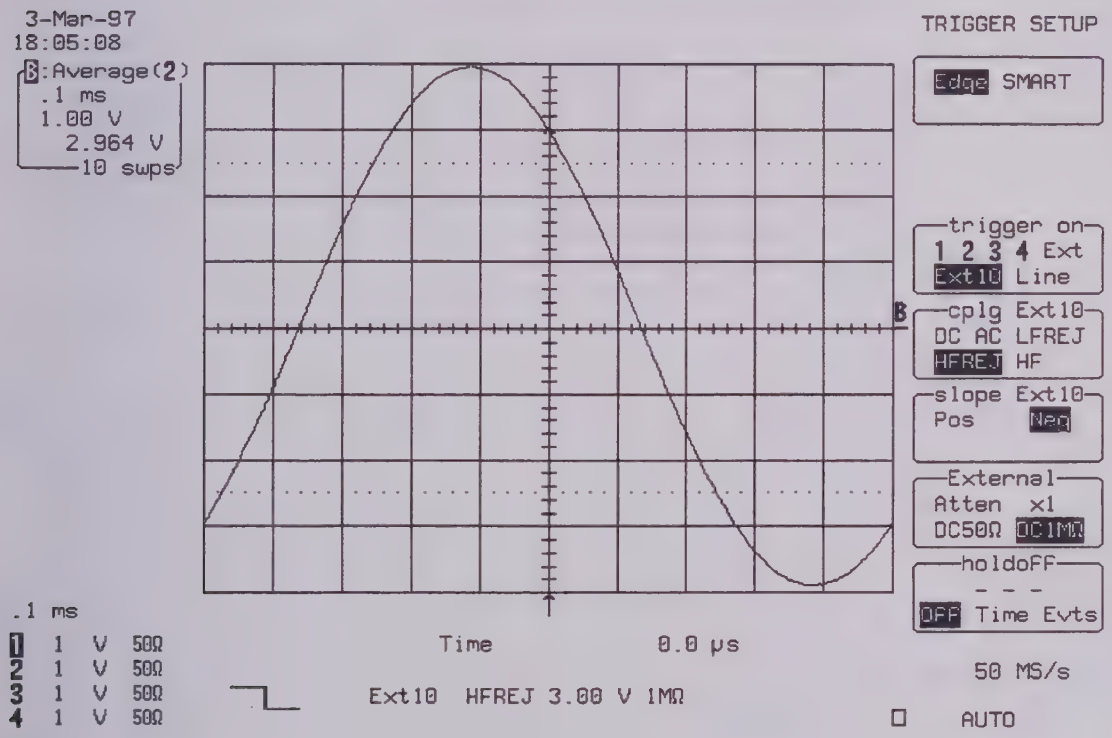
- Connect the test equipment as shown in Figure 5-12.
- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.



- Set Trigger Slope Ext/10 : **Neg**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.

b. HFREJ Coupling

- Set Ext/10 Coupling: **HFREJ**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.



- Set Trigger Slope Ext/10 : **Pos**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.

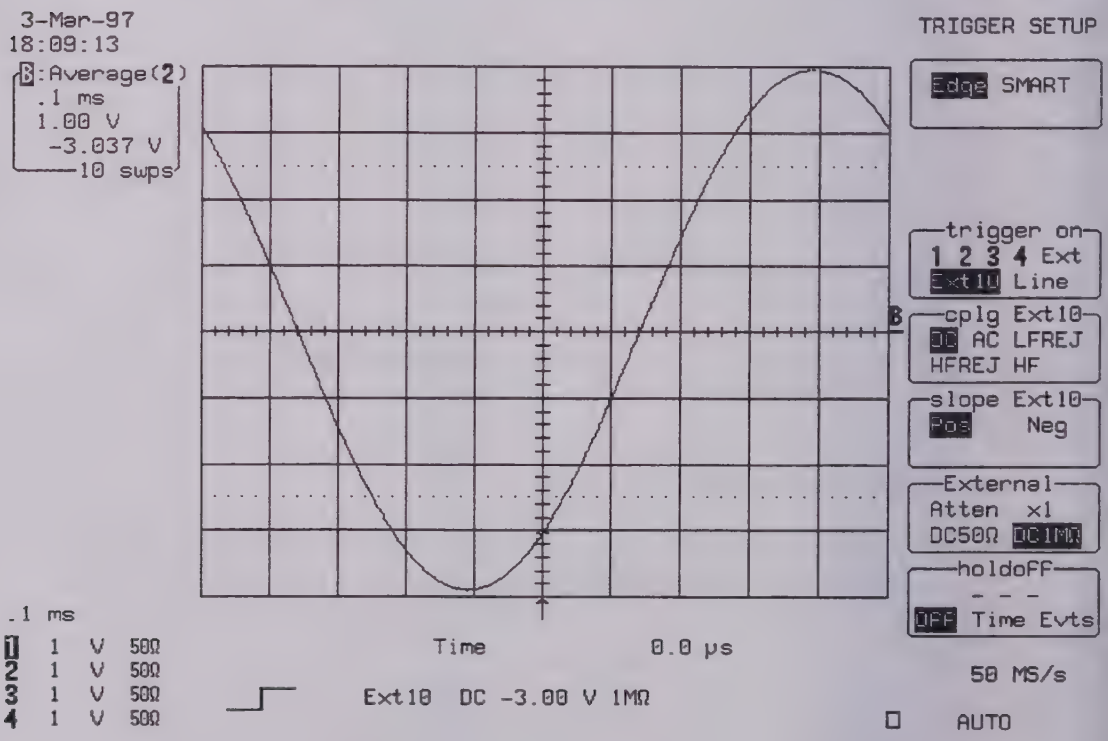
5.10.10 External/10 Trigger at –3 Divisions Threshold

a. DC Coupling

- Recall **574p060.PNL** or configure the DSO as shown in 5.10.5.a and make the following change :

  Set Ext/10 Trigger level : **DC –3 V**

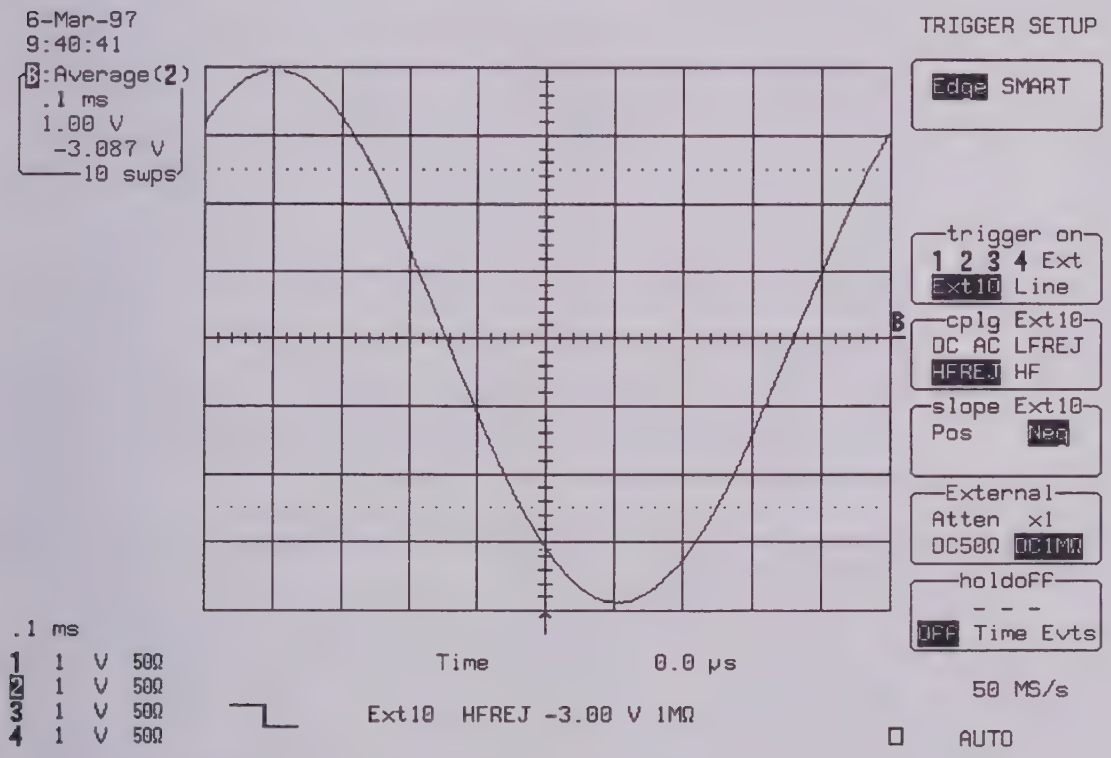
- Connect the test equipment as shown in Figure 5-12.
- Press **Clear Sweeps**.
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.



- Set Trigger Slope Ext/10 : **Neg**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.

b. HFREJ Coupling

- Set Ext/10 Coupling: **HFREJ**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.



- Set Trigger Slope Ext/10 : **Pos**
- Acquire 10 sweeps and record in Table 20 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

5.11 Smart Trigger

5.11.1 Trigger on Pulse Width 10 nsec

a. Pulse Width < 10 nsec

- Recall **574p061.PNL** or configure the DSO

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channels trace ON		**Channel 1**
Input coupling	:	**DC 50Ω**
Input gain	:	**.5 V/div.**
Input offset	:	**0 mV**
Trigger setup	:	**Smart**
Setup Smart Trigger		**Glitch**
Trigger on	:	**1**
At the end of	:	**Neg.**
Width < 10 nsec	:	**On**
Width > 10 nsec	:	**Off**
Trigger mode	:	**Norm**
Timebase	:	**5 nsec/div.**

- Connect the **RF output** of the HP8648B generator through a 5ns 50 Ohm BNC coaxial cable into Channel 1.

- Set the generator frequency to **100 MHz**. Adjust the generator output amplitude to get **5 divisions peak to peak .**

- Check that the scope Triggers. Record the test result in Table 21.

- Set Width < 10 nsec **Off** and Width > 10 nsec **ON**

- Check that the scope **doesn't trigger :** slow trigger and no flashes in box next to normal. Record the test result in Table 21.

b. Pulse Width > 10 nsec

- Set the generator frequency to **40 MHz**.

- Set Width < 10 nsec **Off** and Width > 10 nsec **ON**

- Check that the scope Triggers. Record the test result in Table 21.

- Set Width < 10 nsec **On** and Width > 10 nsec **Off**

- Check that the scope **doesn't trigger :** slow trigger and no flashes in box . Record the test result in Table 21.

5.11.2 Trigger on Pulse Width 100 nsec

a. Pulse Width < 100 nsec

- Recall **574p062.PNL** or configure the DSO as shown in 5.11.1.a and make the following changes :

  Width < 100 nsec : **On**

  Width > 100 nsec : **Off**

  Timebase : **20 nsec/div.**

- Set the generator frequency to **10 MHz**.
- Check that the scope Triggers. Record the test result in Table 21.
- Set Width < 100 nsec **Off** and Width > 100 nsec **ON**
- Check that the scope **doesn't trigger** : slow trigger and no flashes in box next to normal. Record the test result in Table 21.

b. Pulse Width > 100 nsec

- Set the generator frequency to **4 MHz**.
- Timebase : **50 nsec/div.**
- Set Width < 100 nsec **Off** and Width > 100 nsec **ON**
- Check that the scope Triggers. Record the test result in Table 21.
- Set Width < 100 nsec **On** and Width > 100 nsec **Off**
- Check that the scope **doesn't trigger** : slow trigger and no flashes in box. Record the test result in Table 21.

5.12 Time Base Accuracy

5.12.1 Description

An external sine wave generator of **1 MHz** with a frequency accuracy better than 1 PPM is used.

Specifications

500 MHz clock : accuracy : ≤ **±0.001 % or ≤ ±10 PPM**

5.12.2 500 MHz Clock Verification Procedure

- Recall **574p063.PNL** or configure the DSO

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channels trace ON		**Channel 1**
Input coupling	:	**DC 50Ω**
Input gain	:	**.5 V/div.**
Input offset	:	**0 mV**
Trigger setup	:	**Edge**
Trigger on	:	**1**
Coupling 1	:	**DC**
Slope 1	:	**Pos**
Level 1	:	**0.5 V**
Trigger mode	:	**Norm**
Delay	:	**0 %**
Timebase	:	**.5 µsec/div.**
Channel use	:	**4**
Record up to	:	**50 k**

- Connect the **RF output** of the HP8648B generator through a 5ns 50 Ohm BNC coaxial cable into Channel 1.
- Set the generator frequency to **1 MHz**.
- Adjust the generator output amplitude to get **5 divisions peak to peak .**
- Store Channel 1 in Memory 1
- Recall **574p064.PNL** or make the following change :
- Set Post-trigger delay to **5.00 msec**
- Recall Memory **1 to A**

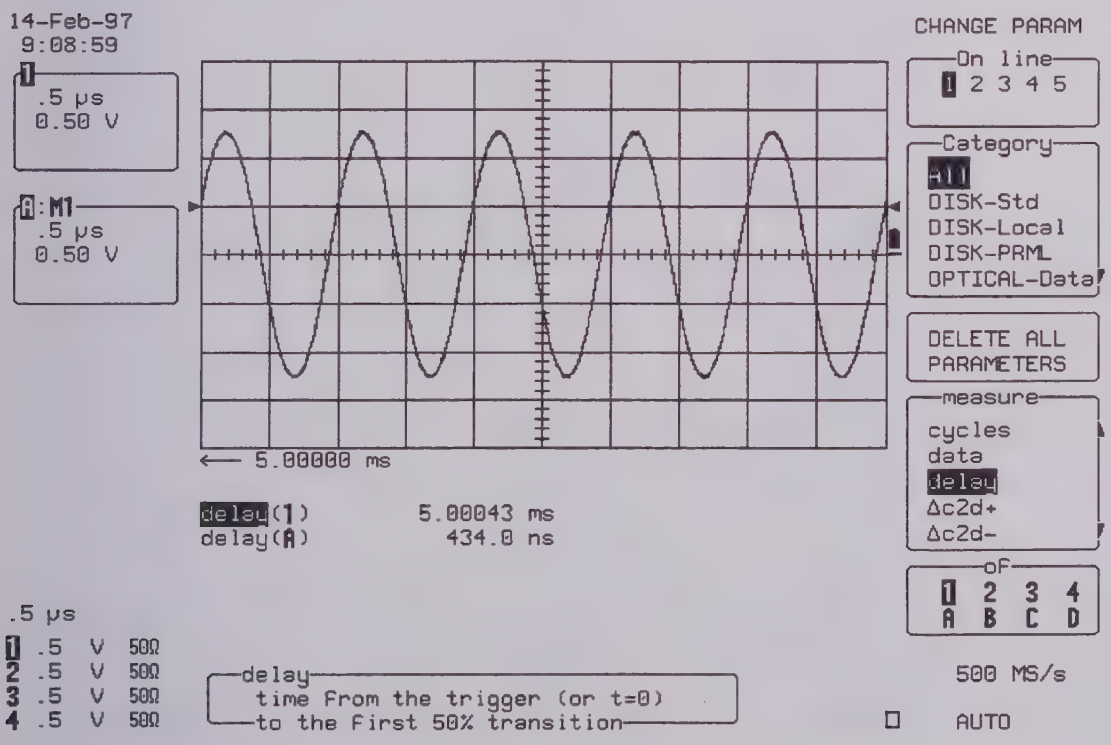
- Press : **Cursors/Measure**
- Measure : **Parameters**
- Mode : **Custom**
- Statistics : **Off**

- Change parameters

- On line 1 : **Delay of 1**
- On line 2 : **Delay of A**

- Check that the displayed Channel 1 trace is **aligned** with the sine wave from memory 1.

- This allows the accuracy of the time base clock to be checked **5000 periods** after the trigger point. A difference of **±0.05 µsec** corresponds to **±10 PPM**.



- Calculate the Difference **{[delay(A) - delay(1)]+ 5 msec}.**

- Record the test result in Table 22, and compare it to the limit in the test record.

5.13 Overshoot and Rise time (10 % - 90 %)

Specifications

DC 50Ω, 50 mV/div., : overshoot < 20 %, rise time < 0.5 ns
DC 1MΩ, 100 mV/div., : rise time < 1.5 ns

a. DC 50Ω

- Recall **574p065.PNL** or configure the DSO

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channels trace ON		**Channel 1**
Input coupling	:	**DC 50Ω** on all 4 Channels
Input gain	:	**0.1 V/div.** on all 4 Channels
Input offset	:	**–250 mV** on all 4 Channels
Trigger setup	:	**Edge**
Trigger on	:	**1**
Coupling 1	:	**DC**
Slope 1	:	**Pos**
Level 1	:	**250 mV**
Trigger mode	:	**Norm**
Delay	:	**30 % Pre-Trigger**
Timebase	:	**1 nsec/div.**
Channel use	:	**4** RIS
Record up to	:	**50 k**
Turn on trace	:	**A**
Select Math Setup		
For Math	:	**Use at most 1000 points**
Use Math ?	:	**Yes**
Math Type	:	**Average**
Avg Type	:	**Summed**
Of	:	**Channel 1**
Sweeps	:	**100**
Turn off trace	:	**Channel 1**
Cursors/Measure	:	**Parameters**
Mode	:	**Custom**
Statistics	:	**Off**
Change Parameters	:	
On displayed trace	:	**A**
On line 1	:	
Measure	:	**Over + of A**
On line 2	:	
Measure	:	**Rise of A**

- Connect the fast pulse generator 4969A and PB049 power adapter, or equivalent as shown in Figure 5-13.

- Set the 4969A frequency to **1 kHz**

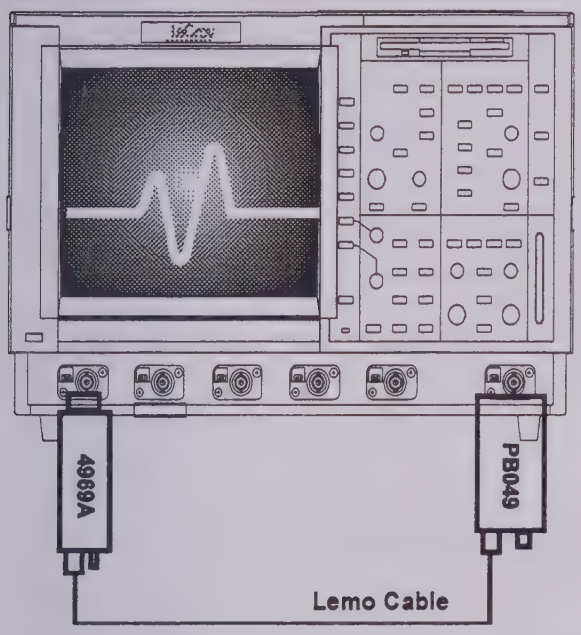


Figure 5-13 : 50 Ω Overshoot & Rise time Equipment Setup

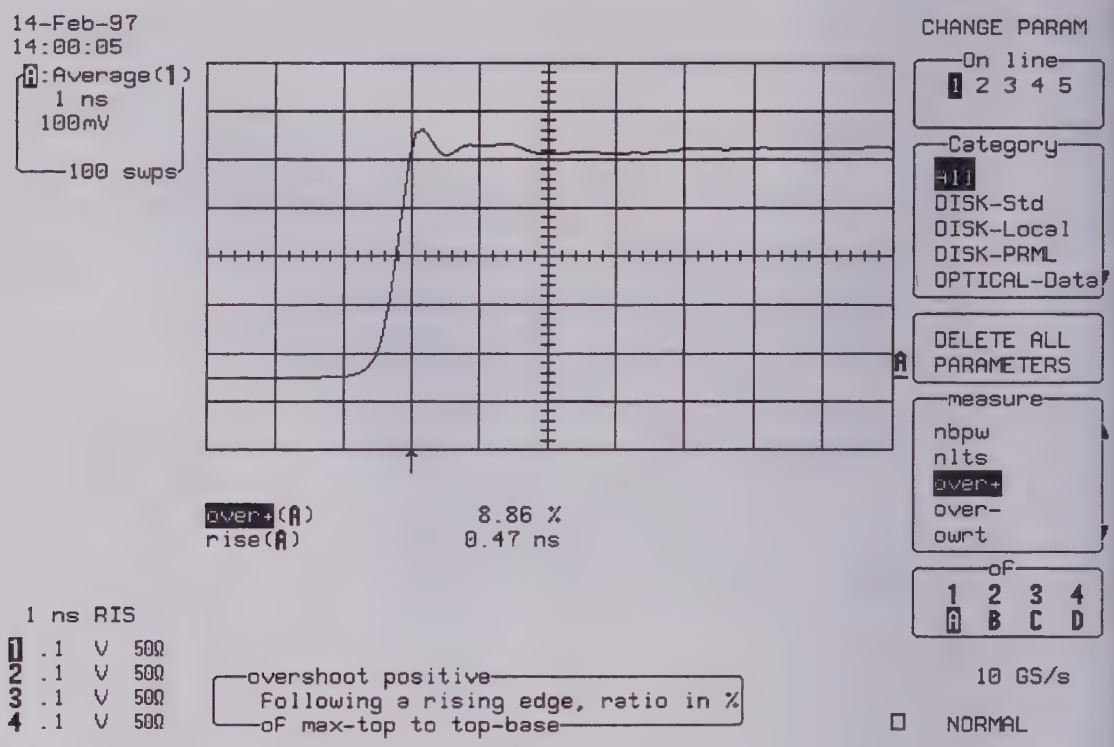
- Press **Clear Sweep**

- After 100 sweeps record **over+(A)** and **rise(A)** measurements in Table 23.

- Repeat the DC 50Ω Overshoot and Rise time test for the other channels, substituting channel controls and input connector.

- Recall **574p066.PNL** for Channel 2, **574p067.PNL** for Channel3 **574p068.PNL** for Channel 4, or configure the DSO as shown in 5.13.a. and make the necessary changes.

- Record the test results in Table 23, and compare the results to the limits.



b. DC 1MΩ

- Recall **574p069.PNL** or configure the DSO as shown in 5.13.a. and make the following change :

  Set Input Coupling: **DC 1MΩ** on all 4 Channels
  Input gain : **50 mV/div.** on all 4 Channels
  Input offset : **–150 mV** on all 4 Channels
  Trigger Level : **75 mV**
  Timebase : **1 nsec/div.**

- Terminate the output of the 4969A Pulser with the 4962-9 adapter (50Ω to 1MΩ) as shown in Figure 5-14.

- Press **Clear Sweep**. After **100 sweeps** record **over+(A)** and **rise(A)** in Table23.

- Repeat the DC 1MΩ Overshoot and Rise time test for the other channels, substituting channel controls and input connector.

- Recall **574p070.PNL** for Channel 2, **574p071.PNL** for Channel3 **574p072.PNL** for Channel 4, or configure the DSO as shown in 5.13.a. and make the necessary changes.

- Record the test results in Table 23, and compare the results to the limits.

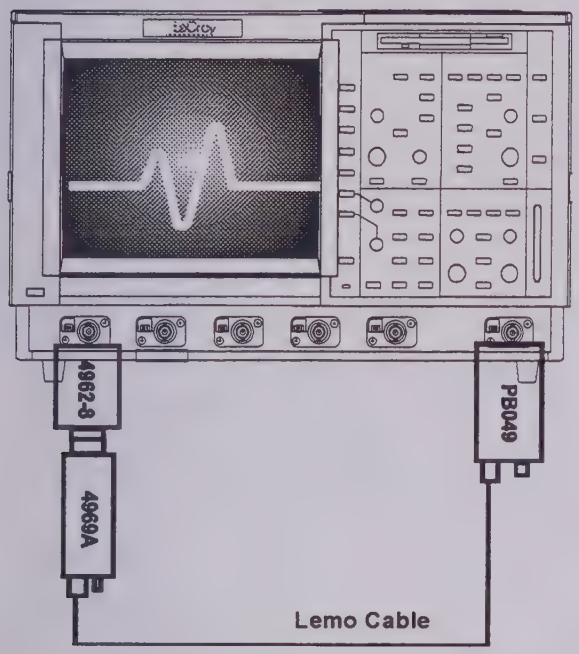


Figure 5-14 : 1MΩ Overshoot & Rise time Equipment Setup

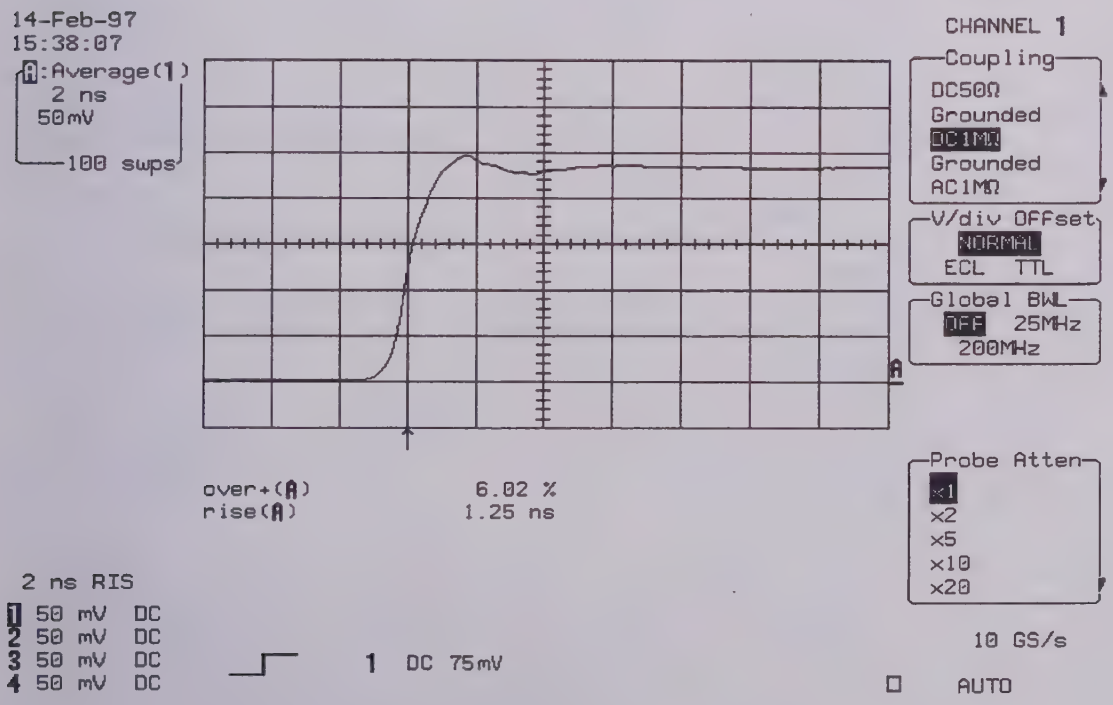


5.14 Overload

Specifications

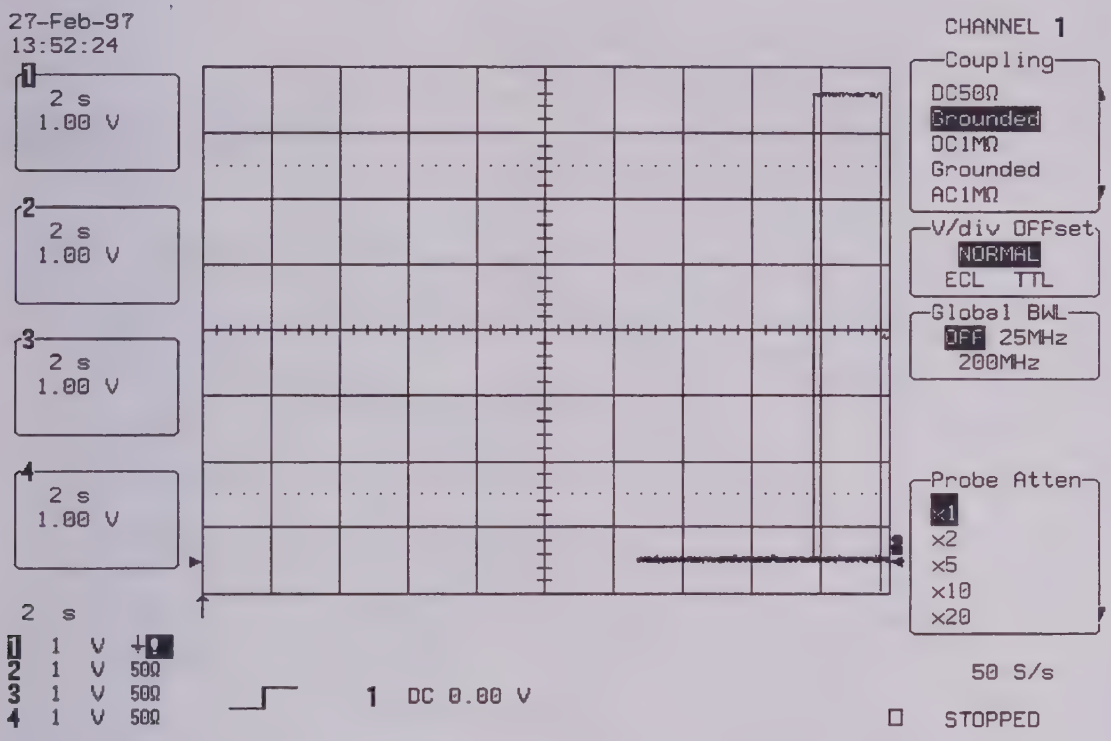
1 Watt into 50Ω : Overload Trip < 17 seconds

a. Channel Overload Trip

- Recall **574p073.PNL** or configure the DSO

Panel Setups	:	**Recall FROM DEFAULT SETUP**
Channels Trace ON		**Channel 1, Channel 2, Channel 3 & Channel 4**
Input coupling	:	**DC 50Ω** on all 4 Channels
Input gain	:	**1 V/div.** on all 4 Channels
Input offset	:	**–3.5 V** on all 4 Channels
Trigger setup	:	**Edge**
Trigger on	:	**1**
Coupling 1	:	**DC**
Slope 1	:	**Pos**
Level 1	:	**0 V**
Trigger mode	:	**Norm**
Delay	:	**zero**
Timebase	:	**2 sec/div.**
Channel use	:	**4**
Record up to	:	**1000 samples**

- Set the output of the external **DC voltage source** to **+7.07 Volt** corresponding to 1 Watt into 50Ω.
- Connect the **DC voltage reference source** through a BNC cable into Channel1.
- When the channel **overload trips** press **Stop** to halt the acquisition.
- **Measure** on the screen the **overload trip time** and record it in Table 24.
- Repeat the above tests for Channel 2, Channel 3 and Channel 4 substituting the input connector.
- Record the test results in Table 24, and compare the results to the limits.
- For all Channel **clear the overload** by selecting DC 50Ω in the Coupling menu.
- Set Timebase : **5 sec/div.**



- Set the output of the external **DC voltage source** to **+5.00 Volt** corresponding to 0.5 Watt into 50Ω.

- For all channels check that the overload doesn't trip for at least **35** seconds. Record the test result in Table 24.

b. External Overload Trip

- Recall **574p074.PNL**, or configure the DSO as shown in 5.14.and make the following changes.

Channel Trace ON	:	**Channel 2**
Input coupling	:	**DC 1MΩ**
Trigger on	:	**Ext**
Slope Ext	:	**Pos.**
External	:	**DC 50Ω**
Mode	:	**Norm**
Set Trigger level	:	**DC 0.0 mV**

- Connect the test equipment as shown in Figure 5-15.

- Set the output of the external **DC voltage source** to **+7.07 Volt**

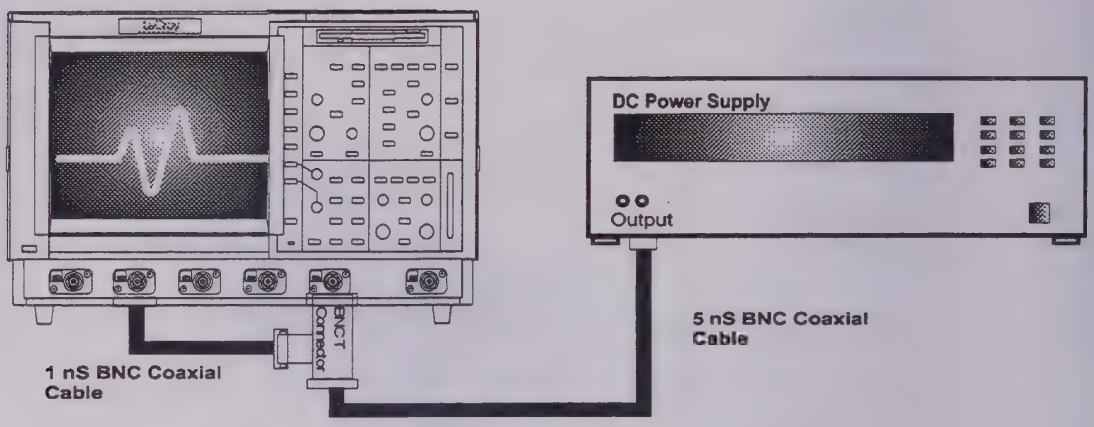


Figure 5-15 : External Overload Equipment Setup

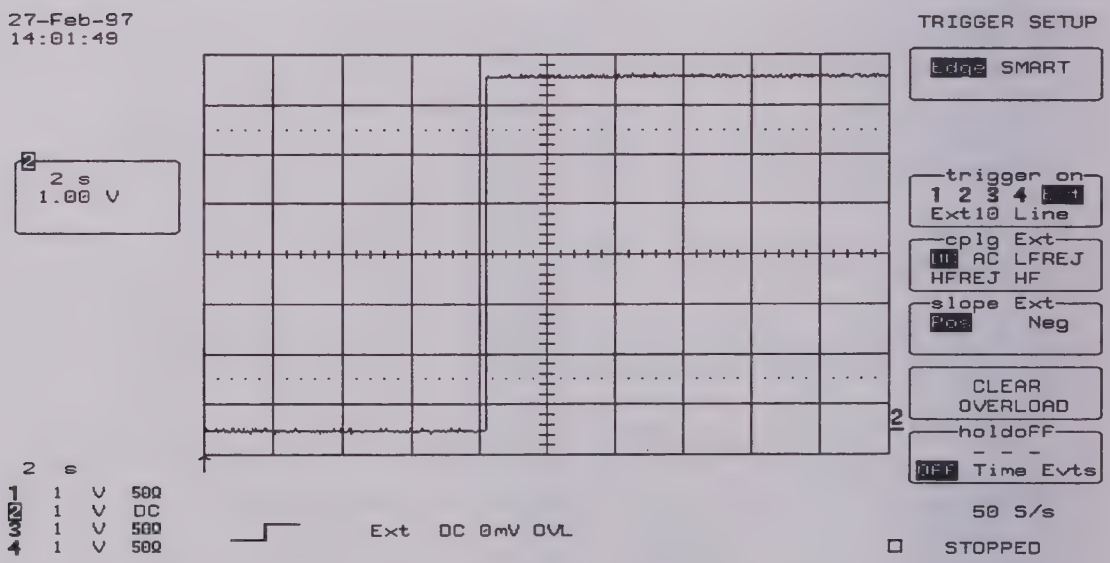
- When the External **overload trips** press **Stop** to halt the acquisition.
- **Measure** on the screen the **overload trip time** and record it in Table 24. Compare the result to the limit in the test record.
- Press **clear overload** in the trigger setup menu.



- Set Timebase : **5 sec/div.**
- Set the output of the external **DC voltage source** to **+5.00 Volt**
- Check that the External overload doesn't trip for at least **35** seconds. Record the test result in Table 24.

6. Maintenance

6.1 Introduction

This section contains information necessary to disassemble, assemble, maintain, calibrate and troubleshoot the LeCroy LC574A, LC574AM & LC574AL digital oscilloscopes.

6.1.1 Safety Precautions

The symbol used in this manual indicates dangers that could result in personal injury.

The symbol used in this manual identify conditions or practices that could damage the instrument.

The following servicing instructions are for use by qualified personnel only. Do not perform any servicing other than contained in service instructions. Refer to procedures prior to performing any service.

Exercise extreme safety when testing high energy power circuits. Always turn the power OFF, disconnect the power cord, discharge the cathode ray tube and all capacitors before disassembling the instrument.

6.1.2 Antistatic Precautions

Any static charge that builds on your person or clothing may be sufficient to destroy CMOS components, integrated circuits, Gate array's.....etc.

In order to avoid possible damage, the usual precautions against static electricity are required.

- Handle the boards in antistatic boxes or containers with foam specially designed to prevent static build-up.
- Ground yourself with a suitable wrist strap.
- Disassemble the instrument at a properly grounded work station equipped with antistatic mat.
- When handling the boards, do not touch the pins.
- Stock the boards in antistatic bags.

6.2 Disassembly and Assembly Procedure

The disassembly and assembly procedures detailed below refer to the views of figures shown in section 8.

6.2.1 Disassembly Procedure

Please study the figures in section 8 before attempting disassembly.
Before removing any parts from the LeCroy LC574A, be sure to read carefully the instructions referring to those parts, noting any precautions needed to avoid problems.

Extreme caution should be taken in protecting the glass CRT face-plate from damage (e.g. scratch marks etc.) when handling, in particular when inserting or removing from the instrument.

a. Removal of the Upper Cover Assembly

The upper cover disassembly procedure refers to the view of figure 8-1.

- Remove three M3X6 screws underneath the plastic bezel.
- Pivot up the plastic bezel and remove it from the front frame by disengaging the hooks on the top of the bezel from the corresponding front frame lugs.

The top cover is secured by seven M3x6 screws on the front panel assembly and by two M5 screws on the rear panel.

- Remove the seven M3X6 screws (three M3X6 on top, two M3X6 on left and two M3X6 on right).
- Remove the two M5 screws that secure the two upper feet on the upper cover and rear panel.
- Carefully slide the upper cover off the unit (disconnect optional Internal printer cables from power supply and processor board).

b. Removal of the Front Frame Assembly with Color Monitor

The front frame disassembly procedure refers to the view of figure 8-2 and 8-10.

- Remove the upper cover assembly (6.2.1.a)
- Remove two M3X6 screws that secure the front frame on both side of the lower cover.
- With a long hex screwdriver unlock two M4X5 screws that secure the monitor on rear of the main board upper shield, and two M3X6 screws that secure the front frame on the main board upper shield.
- Disconnect the monitor VGA cable from the F9601-2 card connector J1
- Disconnect the monitor power cable from the F9601-8 board connector J3

- Disconnect the monitor cable from the external adjustment board.
- Disconnect the floppy cable from the processor board connector J1
- Disconnect the front panel cable from the processor board connector J2

The front frame assembly with monitor, front panel and floppy disk drive can with care be removed forward from the unit.

c. Removal of the Processor Board

The processor board disassembly procedure refers to the view of figure 8-1 & 8-20.

- Remove the upper cover assembly (6.2.1.a)
- Remove the front frame assembly (6.2.1.b)
- Disconnect the processor cable J10 from the F9601-2 card connector J4
- Disconnect the processor cable J9 from the F9300-4 RS232 & GPIB interface and optional F9300-8 hard disk interface.

The processor can now be removed vertically from the main board connector J1.

d. Removal of the Power Supply Assembly

The power supply disassembly procedure refers to the view of figure 8-3 & 8-20.

- Remove the upper cover assembly (6.2.1.a)
- Remove the front frame assembly (6.2.1.b)
- Remove the processor board (6.2.1.c)

If the instrument is equipped with hard disk option, remove the F9300-8 interface from the rear panel, by removing two M3X6 screws that secure it to the rear panel.

- Remove two M3X6 screws that secure the power supply on the main board upper shield.
- Remove two M3X6 screws that secure the power supply on the rear panel.
- Disconnect the power supply cable from the F9601-8 board connector J2
- Disconnect the fan power cable from the power supply connector J5
- Disconnect the power supply cable from the F9654-32 main board connector J2

The power supply can now be removed from the oscilloscope.

e. Removal of the Upper Shield Assembly

The upper shield disassembly procedure refers to the view of figure 8-4.

- Remove the upper cover assembly (6.2.1.a)

- Remove the front frame assembly (6.2.1.b)
- Remove the processor board (6.2.1.c)
- Remove the power supply (6.2.1.d)

- Remove twelve M3x20 screws that secure the shield to the lower cover.
- Remove six M3X5 screws on both side of the lower cover.
- Remove six M2.5x6 screws that secure the upper shield to the main board front panel.
- Remove three M3X6 screws that secure the upper shield to the rear panel.
- Disconnect the power cable from the F9601-8 board connector J1.

The upper shield can now be removed from the oscilloscope.

f. Removal of the Rear Panel Assembly

The rear panel disassembly procedure refers to the view of figure 8-5.

- Remove the upper cover assembly (6.2.1.a)
- Remove the front frame assembly (6.2.1.b)
- Remove the processor board (6.2.1.c)
- Remove the power supply (6.2.1.d)
- Remove the upper shield (6.2.1.e)

- Remove two M5 screws that secure the two lower feet to the rear panel and lower cover.

The rear panel assembly can now be removed from the oscilloscope.

g. Removal of the Main Board Assembly

The main board disassembly procedure refers to the view of figure 8-7 & 8-8.

- Remove the upper cover assembly (6.2.1.a)
- Remove the front frame assembly (6.2.1.b)
- Remove the processor board (6.2.1.c)
- Remove the power supply (6.2.1.d)
- Remove the upper shield (6.2.1.e)
- Remove the rear panel (6.2.1.f)

- Remove the two acquisition memories
- Remove twelve M3x6 screws that secure the main board to the lower cover.
- Remove three M3X6 standoffs that secure the main board to the lower cover.

The main board can now be removed from the oscilloscope.

6.2.2 Assembly Procedure

Reassemble the unit in the reverse order, check that all screws shown on the drawings in section 8 are used and properly torqued.
Verify that all cables are correctly connected.

Assembly Note :

- **Bezel** : The plastic bezel should be in contact with the CRT all around the screen area. The bezel should not be deformed.
  Adjust to 1.5 mm wide the joint between the bezel and the upper cover.

- **Color Monitor** : Being careful not to damage the protective ground braid.

- **Fan** : Check the fan cable direction. Note the air flow, the fan extracts air from the unit and expels it.

- **Feet** : Check that the lower feet and rear feet are aligned and properly tightened before re-assembly.

- **Filter** : Check that the earth wire is correctly installed and tightened.

- **Floppy** : Adjust the floppy position to obtain the front face tangential to face of the front panel. Check that the door is moving freely and shuts correctly.
  Insert a floppy and eject it to check the mechanism.

- **Front Panel** : Check that knobs rotate freely, are the right size and in the right place.

- **Main Board** :The main card must be parallel and tacked against the bend of the lower cover. Being careful not to bend the board or damage components underneath. The main board must be programmed for the correct memory size. This can only be performed at a factory authorized service center.

- **Rear Panel** : Check the CD9610 trimming adjustments are aligned with the holes in the rear panel.

- **Processor** : Check that the memory card insertion guide is correctly inserted in the front panel.

- **Power supply** : Extend the power supply cable to connect it to the main board.

- **Printer** : If the graphic printer is used, before closing don't forget to plug the input cable to the option and the driver cable to the processor card.

6.3 Software Update Procedure

6.3.1 Upgrading Firmware

LeCroy Corporation has a policy of continually improving and upgrading its products.

The LC574A instrument is equipped with flash Prom on processor board. The software is updated to the latest version using either the floppy disk drive or the memory card interface.

After any software change, reboot the scope or perform a general reset of the instrument by simultaneously depressing the autosetup button, the top menu button and the return button.

To update an LC574A scope from software version earlier than 7.1.0, first update to 7.1.0, then proceed to update as described below.

6.3.1.1 Firmware Update Procedure from Floppy

a. Creating the Disk

- Format a single high density 1.44Mb floppy in the scope (not in the PC)
- Create a directory LECROY_P in the root of the card
- Copy the file LCXXX7XX.FLA, into the directory created above.
- Label this disk " Firmware Update Disk "

b. Performing the Update from Floppy

- Cycle power to the scope with no floppy or card inserted.
- When the scope boots enter the "Show Status" , "System" menu to verify that version 7.1.0 or later is running.

- Insert the Firmware Update Disk into the scope's floppy drive.
- Select "Utilities", "Special Modes", "Firmware Update", "Update from Floppy" .
- Press twice "Update Flash".

- When the operation is complete remove the floppy and reboot the scope.
- When the scope boots enter the "Show Status", "System " menu to verify that version 7.X.X is currently running.

6.3.1.2 Firmware Update Procedure from Memory Card

a. Creating the Update Card

- Follow the above procedure to update FLASH to 7.X.X from a Floppy Disk.
- Enter the "Internal Diagnostics Menu" by simultaneously pressing the Third and Fourth menu push buttons on the right hand side of the CRT, then release them, and then press the Fifth.
- Select "Flash Update" and use "Xfer Flash to Card" option to create the card. This card will not be readable in a PC since it will not contain a standard DOS file system.

b. Performing the Update from Card

- Cycle power to the scope with no floppy or card inserted.
- When the scope boots enter the "Show Status" , "System" menu to verify that version 7.1.0 or later is running.
- Insert the Card created above into the PCMCIA Slot.
- Select "Utilities", "Special Modes", "Firmware Update", "Update from Card" .
- Press twice "Update Flash".
- When the operation is complete remove the card and reboot the scope.
- When the scope boots enter the "Show Status", "System " menu to verify that version 7.X.X is currently running.

6.3.2 Changing Software Options

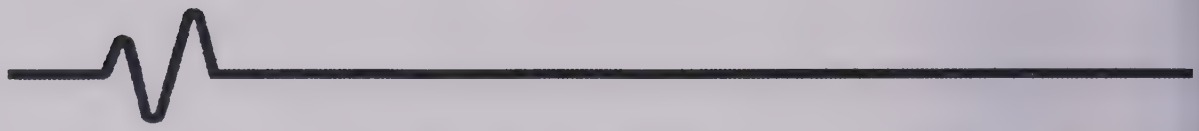
The Software option's selection GAL is located on the processor board at location A48. Insert or replace the GAL to select new options.
Make sure that the orientation notch is correctly aligned with the PCB.

6.3.2.1 Software Option Selection GAL

The following software options are available:

- WP01 Advanced Math Firmware
- WP02 Basic FFT Firmware
- WP03 Parameter Distribution Analysis Firmware

- DDM Disk Drive Measurements
- PRML Partial Response Maximum Likelihood
- ORM Optical Recording Measurement
- DDFA Disk Drive Failure Analysis
- MC01 PCMCIA Memory Card
- MT01/02 Automatic Mask Tester



MC01 200	DDFA 080	ORM 040	PRML 020	DDM 008	WP03 004	WP02 002	WP01 001	KEY XXX-R XXX = Software option,

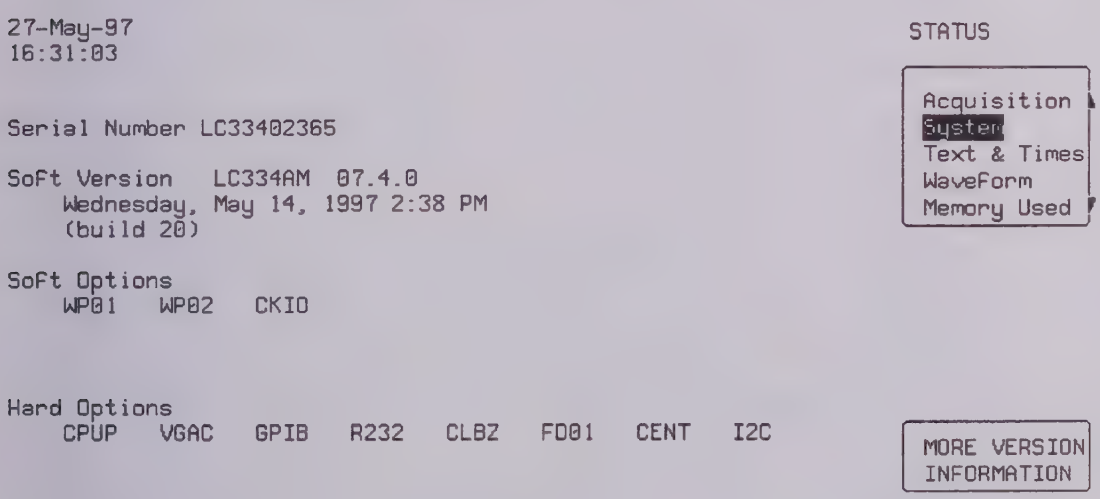
6.3.3 Processor Board Exchange Procedure

The replacement board is supplied without any options. Therefore the existing GAL (Loc. A48) must be transferred from the faulty board to the new board. After upgrading firmware or changing the software option, check that the scope boots correctly. Then check in the system summary, by using the show status button on the front panel, the software version, software options and serial number.

The serial number of the LC574A oscilloscope is loaded in the real time clock memory which is battery backed up. If it becomes necessary to replace the processor board, the serial number must be loaded in the memory of the new board by using LeCroy program " LeCalsoft " under GPIB remote control.

To run " LeCalsoft " type SKP.exe, in the main menu type S, and follow the instructions, use five digits to enter the serial number (i.e. 02365).



6.4 Equipment and Spare Parts Recommended for Service

6.4.1 Test Equipment Required

See Table 5-1 in section 5.2.

6.4.2 LC574A, LC574AM and LC574AL Spare Parts

LeCroy P/N	Assembly	Adjustments	Performance Tests
F9601-1-8	Power PC, 2X4MB DRAM for LC574A & LC574AM	None	None
F9601-1-64	Power PC, 2X32MB DRAM for LC574AL	None	None
F9601-2	Internal + External VGA Centronics Interface	None	None
9384M-2	Acquisition Memory 2X500k for LC574A & AM	None	None
9384MEM-2	Acquisition Memory 2 x 2M for LC574AL	None	None
F9384-31	Acquisition Card	6.5.2	Chapter 5
F9354-4	Timebase Board	None	Chapter 5
F9300-4	GPIB Interface RS232 Interface	None	None
FP9604	Front Panel Assy 4 Channel	None	None
F9602-5	Keypad	None	None
F9604-5	Front Panel	None	None
F9601-6	Floppy Disk Drive Assy	None	None
F9300-7	Printer Interface	None	None
F9300-8	Hard Disk Interface	None	None
F9601-8	Main Switch Board	None	None
CD9610	CD9600 10"Color Display, VGA 640 x 480 points with Magnetic Cancellation Coil.	6.5.3	None
PSLC574	Power Supply LC574	6.5.1	None
900024	Power Supply LC574 w/Fan	6.5.1	None

The other parts are not on the above list because the probability of failure is very low.

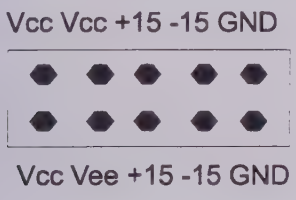
See chapter 7, 8 & 9 for mechanical and electrical replaceable parts.

6.5 Calibration Procedures

The following section includes the manual adjustments of the power supply, front end acquisition board and color monitor, but does not contain any calibration instructions about the Analog to Digital Converter.
The ADC adjustments require complex test set-up and calibration Software.

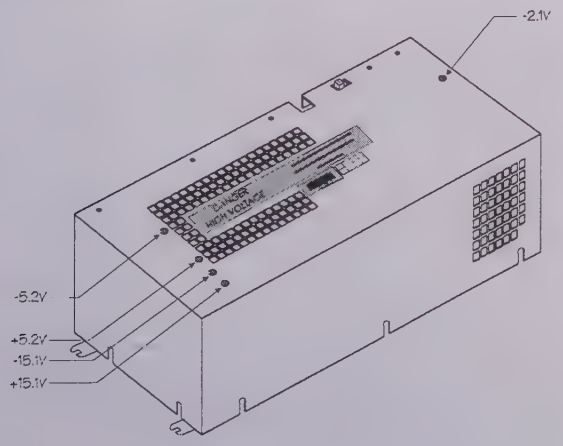
6.5.1 Power Supply Calibration Procedure

- Remove the upper cover assembly (see 6.2.1.a)
- To ensure adequate main board cooling, it is necessary to control the air flow by installing a **temporary closure plate** which fully encloses the air space behind the monitor.
- Turn on the power, set the scope to **Auto Trigger**, and perform the adjustments to get on processor board connector J11:



Vcc	: **- 5.2 VDC**	(Min - -5.30 V, Max = -5.10 V)
Vee	: **+ 5.2 VDC**	(Min - +5.10 V, Max = +5.30 V)
+15	: **- 15.1 VDC**	(Min - +5.05 V, Max = +15.15 V)
-15	: **+ 15.1 VDC**	(Min - -15.15 V, Max = -15.05 V)
-2	: **- 2.1 VDC**	(Min - -2.15 V, Max = -2.05 V)
+3.3	: **+ 3.3 VDC**	(Min - +3.25 V, Max = +3.35 V) not adjustable

The five potentiometers are accessible from the top through holes in the 900024 power supply chassis.



- Turn the potentiometer clockwise to increase the voltage or counterclockwise to decrease it. When the adjustment is done, stop the acquisition by depressing the stop trigger push button, and verify that there is no large difference on the + 5.00 V, typically less than 80 mV.

6.5.2 Color Monitor Calibration Procedure

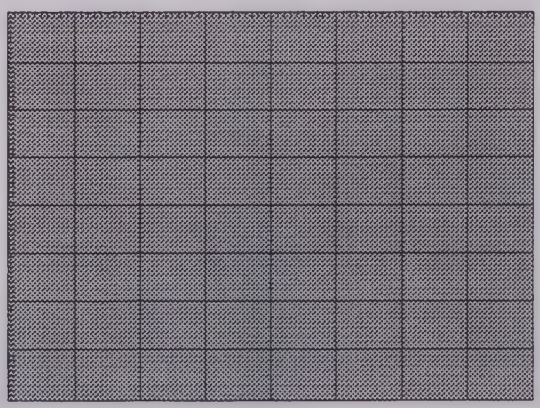
This procedure describes the adjustments for the CD9610 display used in the LC574A series digital storage oscilloscopes.

For reasons of operator safety, no internal part of the display should be touched directly or accessed with any metallic object. All internal safety warning labels should be observed closely.
Any internal display adjustment should be performed using non-magnetic, insulated adjustment tools.
The display system should be oriented on the test bench so the CRT neck is facing magnetic west.
The tests should be performed well away from sources of magnetic radiation. If in doubt, the screen image should be observed for any change whilst the source of potential magnetic radiation is switched on/off (e.g. PC Monitor). If any change is visible on geometry or other effects, the setup environment is unsuitable.

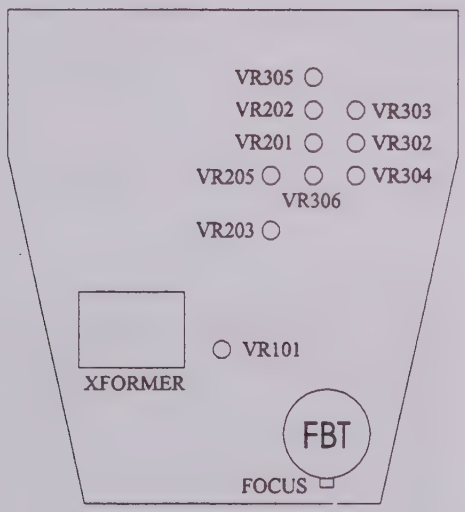
a. Adjustment of Screen Image Position and Size

- Enter the internal menus by pressing menu soft-keys 3 & 4, then release them, then press soft-key 5.
- Select "**Maintenance**", "**Screen Test**", "**Test Images**"
- Select screen test image CD3 by rotating the Time/Div front panel control.

CD96xx Test Grate 3



- Adjust **VPOS** and **VSIZE** controls on the external adjustment board to nominally centre the screen image vertically and obtain a vertical size of 125 mm ± 0.5mm where there is approximately 5mm at the top and bottom between the test image area and the front panel bezel.



Position of Adjustment Potentiometers on Main Circuit Board

Adjustment	Purpose	Comments
VR101	Power Supply Adjust	Do Not Adjust
VR201, 202	Horizontal Phase	Do Not Adjust
VR203	Horizontal Position	Adjustable on external adjustment board
VR205	Horizontal Synchronization	Do Not Adjust
VR302	Vertical Size	Adjustable on external adjustment board
VR303	Trapezium	Adjust if required
VR305	Pin-Cushion	Adjust if required
VR304	Vertical Linearity	Adjust if required
VR306	Horizontal Size	Adjust if required
Focus	Focus	Adjust if required

- Remove the upper cover of display by removing the 9 retaining screws.

- Adjust **HSIZE VR306** control on the main board to obtain a horizontal width of 170mm +3.00mm, -7.00mm.

note: the addition of the CD9610-2 cancellation coil assembly has the effect of reducing the screen width by approximately 4mm.

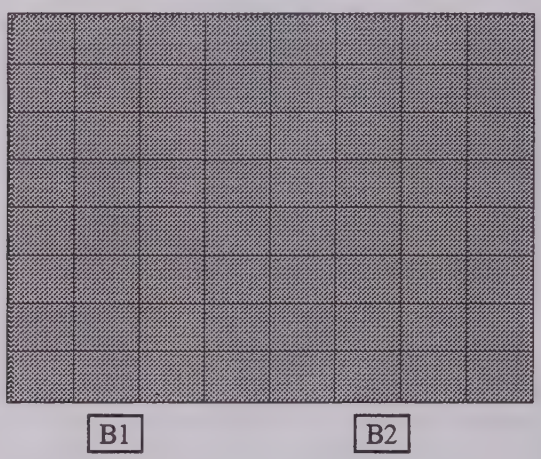
- Adjust **HPOS** control on the external adjustment board to center the screen image horizontally and to obtain a distance at either side of the screen image to the bezel of 2mm.

b. Image Rotation Adjustment Procedure

This procedure is carried out by aligning the CRT within the display chassis.

Note: The rotation of the deflection yoke on the CRT neck should not be attempted as it affects significantly the convergence adjustment of the screen.

CD96xx Test Grate 3



- Loosen the 4 CRT retaining screws, being careful not to damage the protective ground braid.

- Rotate the CRT within the chassis to obtain the optimal alignment of the screen test image reference points B1 and B2 within the bezel.
  distance B1 to bezel - distance B2 to bezel | <= 1.0 mm

- The 4 CRT mounting lugs should not be allowed to protrude outside the overall CRT chassis sides and bottom or above the CRT chassis top cover.

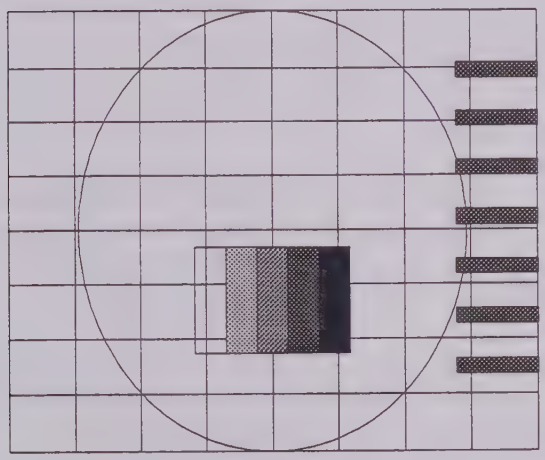
- Tighten the 4 CRT retaining screws.

c. Vertical Linearity

- Select screen test image **CD4** (Magenta Grid on black background) by rotating the Time/Div front panel control.

- Adjust the **VPOS** and **VSIZE** controls to optimize the screen vertical size and position such that the best alignment is obtained of the soft-key menu markings on the bezel and the gray menu control markings on the screen of test image CD4.

CD96xx Test Grate 4



- Verify that the menu markings (each of the 7) on the bezel are aligned horizontally within +- 1.0 mm with the corresponding markings on the screen test image.

d. Control of Screen Image Quality

- Adjust the **Brightness** control on the external adjustment board until the gray-scale test bars on test image CD4 are evenly balanced in color graduation from White to Black. The Black bar (right hand side) should be easily distinguishable from the adjacent bar of dark gray.

- Adjust the **Contrast** on the external adjustment board and **Focus** on the main board until the image is of good quality.

- Verify that there is no jitter of the grid lines (X or Y), the background color is gray and is uniform:
  - No Black holes
  - No color (rainbow) variation
  - No Moiré fringe (wavy lines) visible within the gray background

e. Trapezium & Pin Cushion Adjustment Procedure

- Select screen test image CD3 by rotating the Time/Div front panel control
- Adjust the Trapezium / Pin-Cushion effect using Potentiometers **VR305** and **VR303** (toward the front left of the bottom PCB within the display assembly) until the minimum distortion is achieved.

6.6 Troubleshooting and Flow Charts

6.6.1 Introduction

The troubleshooting information contained in this section is intended for use by qualified personnel having a basic understanding of electronics (analog and digital). In order to simplify servicing and minimize downtime, the following list of possible symptoms, likely causes, and troubleshooting steps have been prepared.
The first step in troubleshooting is to check for obvious items like blown fuses. The power supply is the next item to check before proceeding to more detailed troubleshooting, since noise or low power supply voltages can cause a variety of digital and analog problems.

6.6.2 Line Fuses Replacement

The power supply of the oscilloscope is protected against short circuits and overload by means of two T6.3A / 250 V fuses located above the main plugs.

Turn off the power and disconnect the line cord from the instrument
Disconnect the instrument from other equipment.

To replace line fuses, proceed as follow :

- Open the fuse box by inserting a small flat screwdriver under the plastic cover and remove the fuse carrier from the holder
- Remove the fuse and replace it with the proper type: T6.3 A / 250 V, LeCroy part number: **433 162 630**

6.6.3 Initial Troubleshooting Chart

Most procedures in this section will allow troubleshooting down to the **BOARD LEVEL.**

Defective circuit boards will be repaired or exchanged by the regional LeCroy service office or the local representative (see section 2.2).

7. Replaceable Parts

To order parts, contact your local LeCroy service office. A list of the service centers is given in section 2 of this manual. For boards, you can either order a new board or an exchange board. Exchange assemblies are factory repaired, inspected, tested and calibrated. If you order an exchange card, you must return the defective part.

This section applies to the following model :

LC574A, LC574AM & LC574AL

Lecroy Part Number	Description	Rev	Qty
F9601-1-8 for LC574A & AM	Color UP Card & 2X4MB DRAM	E	1
F9601-1-64 for LC574AL	Color UP Card & 2X32MB DRAM	E	1
F9601-2	Centronics & VGA Interface	F	1
9384M-2 for LC574A & AM	Acquisition Memory 2x500K	B	2
9384MEM-2 for LC574AL	Acquisition Memory 2x1M	B	2
F9384-31	Main Card Quad 1000MS/s	D	1
F9300-4	GPIB + RS232 Interface Card	A	1
F9354-4	Time Base Board	E	1
F9601-6	Floppy Disk Drive Assy	D	1
F9300-7	Printer Controller	F	1
F9300-8	Hard Disk Interface	B	1
F9601-8	Main Switch Assembly	A	1
CD9610	Color Display Assy	D	1
FP9604	Front panel Assy 4 channel	K	1
MLC574A	Mechanical parts	C	1
PSLC574 or 900024	Power supply for Color box	B	1
RPLC574	Rear panel assembly	B	1
LCXXX-GP01	Upper cover assembly	B	1
USLC574	Upper shield rod assembly	B	1
ACC-LC574A	Accessories	H	1
205750000	Gate Array 16v8	A	1
705740301	LC574A Front Label	A	1
705704302	LC574AM Front Label	A	1
705740303	LC574AL Front Label	A	1
709600050	9600 Logo LeCroy	A	1
705740017	LC574 Serial Number Plate	A	1
780981015	Flat cable 2x20 (15 cm)	A	1

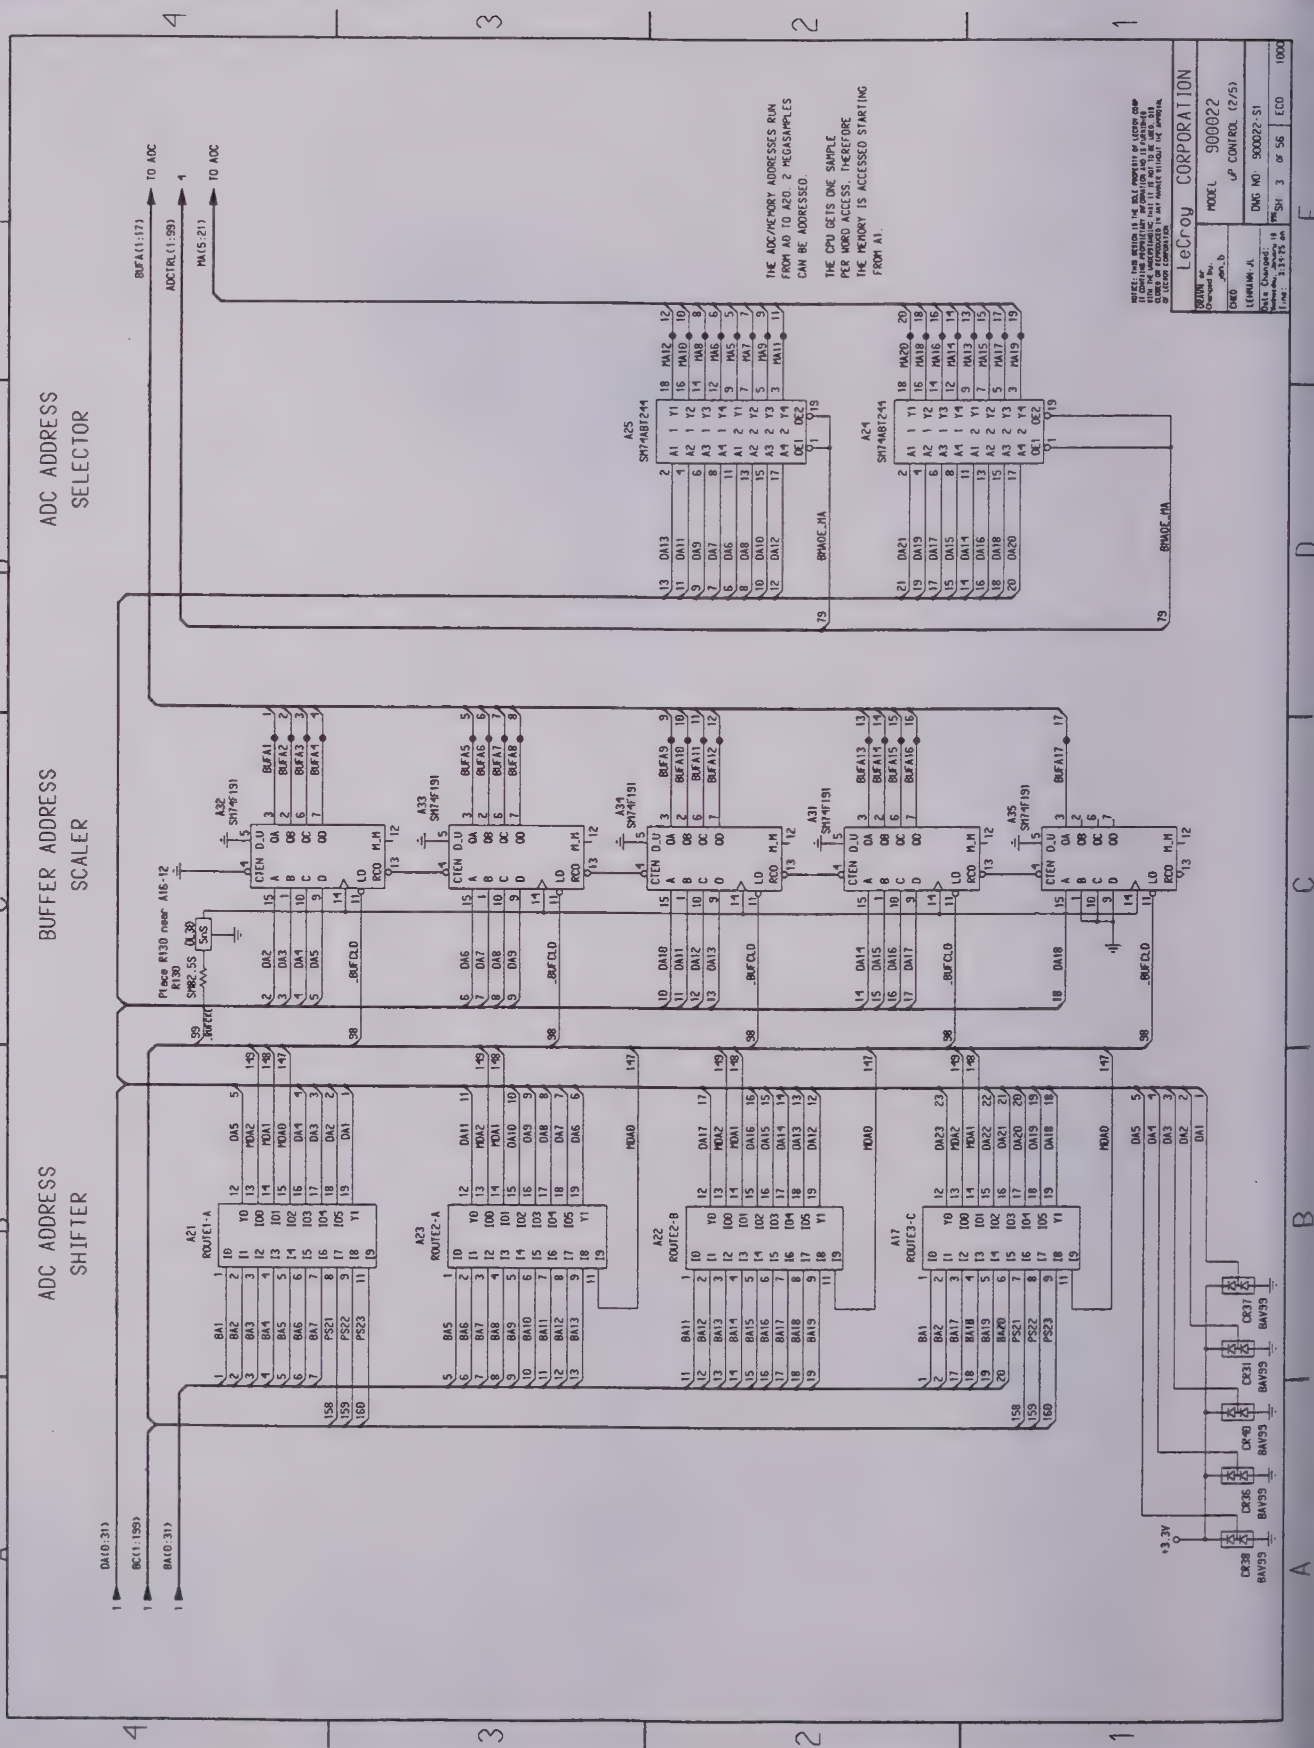
DWG NO 900022-S1
SH 2 OF 56
ECO 1000



ADC ADDRESS SHIFTER
BUFFER ADDRESS SCALER
ADC ADDRESS SELECTOR
THE ADC/MEMORY ADDRESSES RUN FROM A0 TO A20. 2 MEGASAMPLES CAN BE ADDRESSED.
THE CPU GETS ONE SAMPLE PER WORD ACCESS. THEREFORE THE MEMORY IS ACCESSED STARTING FROM A1.

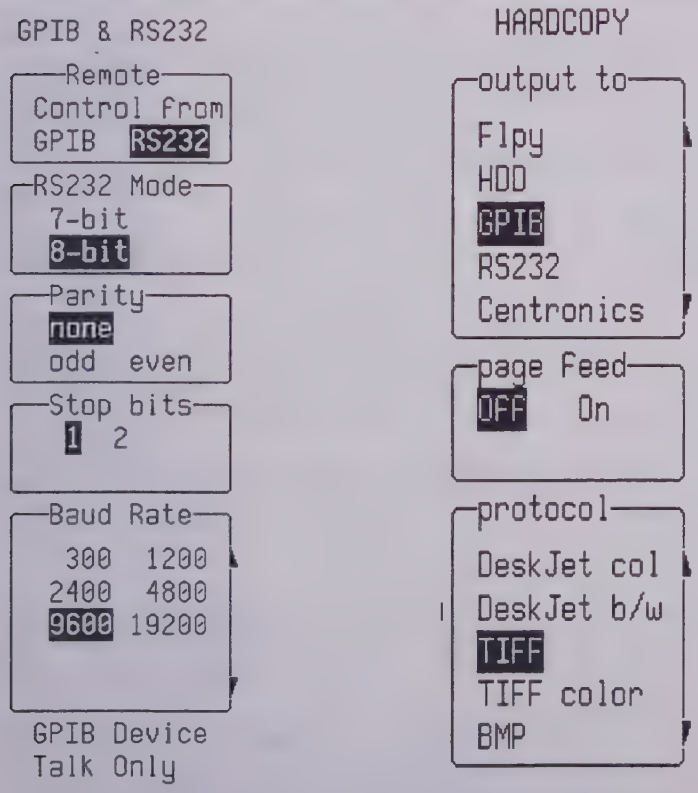
10. Connecting the LC574A

10.1 Introduction

LeCroy oscilloscopes are supplied with a list of plotters and printers known to work with them.
This list is not final, so any suggestions are welcome.

HP plotter responses to some RS-232 configuration commands have been evolved.
Consequently, the LC574A generation DSO support HP plotters of two types, 7470A and 7550A. The only difference lies in the RS-232 initialization codes. They may however, despite these changes, work with HPGL compatible plotters from other manufacturers. If the HPGL data is used as input for a CAD or word processing system, it might be necessary to remove the data preceding the in command.

Before connecting a plotter to a LC574A, do not forget to select the appropriate settings in the printer setup menu and the GPIB & RS-232 setup menu.



RS-232 connection

The following settings are assumed for the scope.

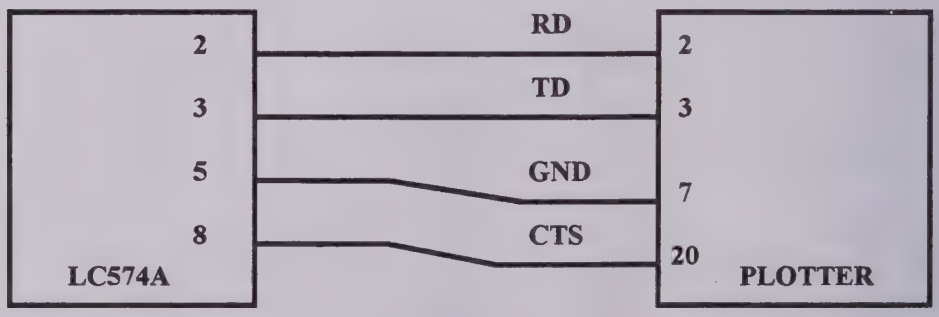
Baud rate	:	9600
Character	:	8 bits
Parity	:	none
Stop bits	:	1

Any exceptions will be mentioned.

RS 232 interface

Pin	1	:	DCD
	2	:	RD
	3	:	TD
	4	:	DTR
	5	:	GND
	6	:	DSR
	7	:	RTS
	8	:	CTS
	9	:	RI

A cable with the following pin out can be used in almost every case:



The cable has D25 connector with male pins on the plotter side, and a D9 connector with female pins on the LC574A oscilloscope side.

GPIB Connection

To have a plot done through GPIB initiated with the front panel screen dump push button, you must set the LC574A in talk only mode by selecting remote control from RS-232, and the plotter in listen only mode.
If a computer controls the GPIB Bus, both the scope and the plotter must be set in addressed mode (remote control from GPIB).
Remark: the listen only mode does not work on some old HP plotters such as HP7585B or HP7475. The plotter must be set to listener before being able to receive any commands, which is a violation of the GPIB standard.

10.2 Plotters

10.2.1 HP 7470A Plotter

Switch settings:

- RS-232 Connection:
  - S1 and S2 : 0 0
  - Y/D : D
  - A4/US : User selectable
  - B4 to B1 : 1 0 1 0
- GPIB listen only:
  - A4/US : User selectable
  - 16 to 1 : 1 1 1 1 1
- GPIB Addressed:
  - A4/US : User selectable
  - 16 to 1 : 0 0 1 1 1

10.2.2 HP 7550A Plotter

Responses to some ESC characters commands are not the same in this plotter as in older HP models like the 7470A. In fact, ESC sequences of commands which give excellent results in the 7470A can prevent any handshake in RS-232. Problems of this kind have been reported in the case of ESC.R and ESC.@ commands. When combined with ESC.I and ESC.N, ESC.@ breaks up all handshakes.

RS-232 configuration:

- Enter into display 5 (HP-IB MONITOR...).
- Select STANDARD OF STANDARD/ENHANCED.
- Enter into SERIAL sub-menu (display 6)
- For DATA_FLOW, select REMOTE. Either STANDALONE or EAVESDROP may be chosen.
- Enter into display 7 (DUPLEX, PARITY, BAUD).
- Select FULL duplex.
- Configuration PARITY and BAUD rate to the same values as on the DSO.

Do not start a plot while a sheet of paper is being loaded!

GPIB configuration:

If the scope is in TALK ONLY, the plotter must be in LISTEN ONLY.
Selection will be done at display 5.
Note : Its seems that the plotter must be powered off, then on again, to take any configuration change into account.

10.2.3 Hitachi 672 Graph Plotter (or NSA 672)

As this plotter is compatible with the 7470A, select this mode on the plotter menu page.
Switch settings

- RS-232 Connection:

Sw. A, 1 and 2	:1 1 (ISO A3) or (ISO A4).
Sw. A, 3 to 8	:1 0 1 1 0 1
Sw. B	:1 1 1 1

Note : When switches are set to ISO A4, the pen must be manually repositioned at the top of the page (or plotter reset by powering it off and on) before loading a new sheet of paper.

10.3 Printers

Interfacing is possible through RS-232, GPIB and Centronics.

10.3.1 Centronics Printers

Most printers use a Centronics parallel connection which makes direct connection possible to the LC574A using the F9300-6 Centronics interface board. If a serial to parallel converter is used, in the printer setup menu select device type Epson, and remote control from RS-232.

RS-232 Remote control port settings:
Baud rate : 9600 or 19200
Characters length (bits): 8
Parity : none
Number of stop bits : 1

The following printers and printer switch positions have been tested via serial to parallel adapter.

	Switch 1	Switch 2
1. Epson LQ-1000	1, 2, 3, 4 : ON	2, 6, 7 : ON
2. Diconix 150P	1 : ON	2, 6, 7 : ON
3. HP-ThinkJet 2225C	2, 4, 5 : ON	
4. HP-DeskJet 550 C	all down	6 up for 19200 bauds

Note: all Epson and Epson Compatible printers are likely to work if the switches are set properly, (Some experimentation may be required).

Some available serial to parallel converters need power through the RS-232 lines. Do not use them, as we do not guarantee that the serial port is able to furnish enough power.

10.3.2 RS-232 Printers

10.3.2.1 Epson FX80

It is possible to use the standard RS-232 cable. Such a printer has the optional RS-232 interface " #8143 " installed. The configuration that follows is valid for the default scope setting. The standard cable is usable.

In the particular case of an FX850:

- the main switches SW1 SW2 remain at the factory configuration

SW1	:	1	2	3	4	5	6	7	8
		OFF	OFF	ON	OFF	OFF	ON	ON	ON
SW2	:	1	2	3	4				
		ON	OFF	OFF	OFF				

- the 8143 switches are set to:

1	2	3	4	5	6	7	8
ON	OFF	OFF	OFF	n/a	OFF	OFF	ON

- the 8143 jumpers remain at the factory settings:

J1	J2	J3	J4	J5	JC	JNOR	JRVE	JF	JX
OFF	OFF	OFF	OFF	ON	OFF	ON	OFF	ON	OFF

Note: Epson printers only support XON/XOFF support handshake if they have a print buffer. Such printer are : FX, FX+, JX-80, LQ-800/1000, EX-800 and LQ-25000. Otherwise, use DTR/RTS handshake.

10.3.2.2 Citizen 120D

To use this printer with the default RS-232 setting and default printer setting of the LC574A, select the following switch configuration:

DIP switch bank 1 : all OFF except 3 and 8
DIP switch bank 2 : all OFF.

10.3.2.3 HP LaserJet

Make sure that page feed is ON in the plotter menu to use the LaserJet. It is advisable to start out in single density with a size of A5. Then, depending upon the internal buffer size on the LaserJet, the image size and/or density can be increased. At one point, the internal buffer size of the DSO is also reached. The image is simply truncated, indicating that either density or size have to be reduced.

10.3.2.4 HP ThinkJet

To use printer with the default RS-232 setting and with the default cable select the following switch configuration:

- Mode switch:

1 2 3 4		5 6 7 8
0 0 0 0	: 11" page length	0 0 0 0
1	: 12" page length	

- RS-232 switch:

1	2 3	4 5
1	0 0	0 0
(use DTR handshake)	(8bits, parity none)	(9600 bauds)

Note : it may be possible that old ThinkJet recognize only the Epson protocol. If it is the case use the Epson.

10.3.2.5 HP DeskJet 550C

The standard cable is usable. The printer has been tested at 19200 bauds with the following configuration :

Switch 1 or Bank A : all down

Switch 2 or Bank B : 6 up for 19200 bauds, all the other down

10.3.2.6 Brother Printers

The Brother M-1509 and M-1709 have been tested with a serial connection. On the oscilloscope select "Epson FX-80 or compatible printer".

The switch settings are identical for both the printers:

- SW1 :	1	2	3	4	5	6	7	8
	ON	ON	ON	OFF	ON	n/a	n/a	ON

- SW1 :	1	2	3	4	5	6	7	8
	←		ALL OFF			→		

- SW1 :	1	2	3	4	5	6	7	8
	OFF	OFF	OFF	OFF	11" : OFF 12" : ON	OFF	ON	OFF

10.3.3 GPIB Printers

10.3.3.1 HP QuietJet

Make sure the dip switches on the backplane of the printer are set to

- SRQ enable: 0

- GPIB listen only:
  Listen always: 1
  A5 to A1: 0 0 1 1 1

- GPIB Addressed:
  Listen always: 0
  A5 to A1: 0 0 1 1 1

10.3.3.2 HP ThinkJet (HP 2225A)

Make sure the dip switches on the backplane of the printer are set to

- SRQ Enable: 0
- GPIB listen only:
  Listen always 1
  A5 to A1: 0 0 1 1 1

- GPIB Addressed:
  Listen always: 0
  A5 to A1: 0 0 1 1 1

10.3.3.3 HP PaintJet (black/white only)

Make sure the dip switches near the GPIB connector are set to:

- GPIB Listen only:

NORM/SCS:	NORM
A3 to A1:	1 1 1
PC8/ROM8:	N/A
ENG/MET:	has to match paper size ENG = 11" MET = 12"

- GPIB addressed:

NORM/SCS:	NORM
A3 to A1:	any combination except 1 1 1(correspond to add. 0-6)
PC8/ROM8:	N/A
ENG/MET:	has to match paper size ENG = 11" MET = 12"

10.4 Information on GPIB

10.4.1 Introduction

This section is a simple description of the GPIB interface as an aid to understanding the interface in the LC574A DSO: it is not intended as a complete specification of the system.

The GPIB system is designed for the interaction of a number of devices, which may transmit or receive information as required. The system includes data lines over which the actual data are sent, bus management lines for control, and handshake lines to ensure correct acceptance of data at the right destination.

The main features of the bus are summarized below:

Maximum number of devices	15	
Maximum bus length	20 meters or 2 meters per device, whichever is less.	
Connection	star or chain	

Note that more than half of any connected devices must be powered up, even if they will not be used.

Data lines	8 DIO	1 to 8
Handshake lines	DAV	Data available
	NRFD	Not ready for data
	NDAC	not data accepted
Bus management lines	EOI	End or identity
	IFC	Interface clear
	SRQ	Service request
	ATN	Attention
	REN	Remote enable
Active level	+0.4 V	
Inactive level	+3,3 V	

Note that all signal lines are active low, and that they are wire 0Red to allow participation by all devices.
In addition, there are 8 ground lines, making a total of 24 lines.
